- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

TUBE - EXHAUST DIFFUSER TO DUCT (LEFT-HAND) - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00  
Cleaning for details of the cleaning processes referred  
to in Table 201.
- B. To ensure that all items within this breakdown that  
require cleaning and subsequent Inspection/Check are  
recognized, and identified by their Part Number, figures  
are provided which equate with the Illustrated Parts  
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with  
the relevant Figure and Item Number in the same breakdown  
in the I.P.C. Items illustrated in the I.P.C. which are  
not illustrated in this breakdown, are those items which  
are either discarded at overhaul, or are normally assembled  
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the  
figures, Table 201 does not list all items, but deals  
collectively with the items requiring the same cleaning  
process.
- D. On receipt of the items from disassembly, all protective  
blanks, covers etc. deemed necessary for the protection  
of the items will have been assembled and, in addition,  
many of the items will arrive in containers. Any special  
containers, blanks, covers etc. are listed in Table 202  
by their Tool Ref. No. e.g. (Tool 123). For the  
manufacturer's Part No. refer to the appropriate Table in  
Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N,  
INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COM-  
PONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY  
COATINGS. THE NITRIC ACID USED IN PROCESSES J, L  
AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME  
TYPES OF COATING, MAKING REPLACEMENT OF THE COATING  
NECESSARY.

- A. All blanks, covers etc. must be removed from the items  
prior to cleaning and reassembled immediately afterwards.  
Items received in special cleaning containers should  
remain therein during the cleaning procedures unless  
otherwise stated.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

1. General

- A. Prior to commencing the cleaning refer to 72-09-00  
Cleaning for details of the cleaning processes referred  
to in Table 201.
- B. To ensure that all items within this breakdown that  
require cleaning and subsequent Inspection/Check are  
recognized, and identified by their Part Number, figures  
are provided which equate with the Illustrated Parts  
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with  
the relevant Figure and Item Number in the same breakdown  
in the I.P.C. Items illustrated in the I.P.C. which are  
not illustrated in this breakdown, are those items which  
are either discarded at overhaul, or are normally assembled  
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the  
figures, Table 201 does not list all items, but deals  
collectively with the items requiring the same cleaning  
process.
- D. On receipt of the items from disassembly, all protective  
blanks, covers etc. deemed necessary for the protection  
of the items will have been assembled and, in addition,  
many of the items will arrive in containers. Any special  
containers, blanks, covers etc. are listed in Table 202  
by their Tool Ref. No. e.g. (Tool 123). For the  
manufacturer's Part No. refer to the appropriate Table in  
Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N,  
INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COM-

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary reference should be made to the Repair Authority for agreement.

3. GENERAL

## UNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)  
Dimensions in Inches (Millimeters)

Tolerances on machined dimensions plus/minus .010 (0,25)

Tolerance on angles plus/minus 2 degrees

Break sharp edges .004 to .020 (0,1 to 0,5)

Surface texture interpretation to ISO1302 (JES137)

Surface texture to be 125 Microinches (3,2 Micrometers)

Welding symbols to ISO2553 (JES139)

All TASKS identified in this instruction are in the Engine  
Overhaul Processes Manual (TSD 594-J)

4. REPAIR PROCEDURE

## REPAIR PROCEDURE

- 1) Remove paint and clean as necessary.
- 2) Inspect to determine position and extent of damage.

## SUPPLEMENTARY INFORMATION

Refer Overhaul Manual  
Chapter 72-09-00  
Process F. Cleaning.

Refer fig.401 and 402.

TUBE - AIR INTAKE CASE ADAPTER TO CONNECTION ON TUBE (AIR  
INTAKE CASE ADAPTER TO OUTLET SEAL PLATE) - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00  
Cleaning for details of the cleaning processes referred  
to in Table 201.
- B. To ensure that all items within this breakdown that  
require cleaning and subsequent Inspection/Check are  
recognized, and identified by their Part Number, figures  
are provided which equate with the Illustrated Parts  
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with  
the relevant Figure and Item Number in the same breakdown  
in the I.P.C. Items illustrated in the I.P.C. which are  
not illustrated in this breakdown, are those items which  
are either discarded at overhaul, or are normally assembled  
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the  
figures, Table 201 does not list all items, but deals  
collectively with the items requiring the same cleaning  
process.
- D. On receipt of the items from disassembly, all protective  
blanks, covers etc. deemed necessary for the protection  
of the items will have been assembled and, in addition,  
many of the items will arrive in containers. Any special  
containers, blanks, covers etc. are listed in Table 202  
by their Tool Ref. No. e.g. (Tool 123). For the  
manufacturer's Part No. refer to the appropriate Table in  
Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items  
prior to cleaning and reassembled immediately afterwards.  
Items received in special cleaning containers should  
remain therein during the cleaning procedures unless  
otherwise stated.
- B. All items contained in this breakdown must be cleaned by  
the appropriate processes quoted in the table, to achieve  
a cleanliness to enable the Inspection/Check to be carried  
out correctly. Where alternative processes are quoted,  
the operator must decide what process to use depending on  
the amount of contamination of the item. Any item that is  
not cleaned satisfactorily must be recleaned by the  
appropriate process.

CLEANING

- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

- A. Prior to commencing the cleaning refer to 72-09-00  
Cleaning for details of the cleaning processes referred  
to in Table 201.
- B. To ensure that all items within this breakdown that  
require cleaning and subsequent Inspection/Check are  
recognized, and identified by their Part Number, figures  
are provided which equate with the Illustrated Parts  
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with  
the relevant Figure and Item Number in the same breakdown  
in the I.P.C. Items illustrated in the I.P.C. which are  
not illustrated in this breakdown, are those items which  
are either discarded at overhaul, or are normally assembled  
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the  
figures, Table 201 does not list all items, but deals  
collectively with the items requiring the same cleaning  
process.
- D. On receipt of the items from disassembly, all protective  
blanks, covers etc. deemed necessary for the protection  
of the items will have been assembled and, in addition,  
many of the items will arrive in containers. Any special  
containers, blanks, covers etc. are listed in Table 202  
by their Tool Ref. No. e.g. (Tool 123). For the  
manufacturer's Part No. refer to the appropriate Table in  
Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N,  
INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COM-  
PONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY  
COATINGS. THE NITRIC ACID USED IN PROCESSES J, L  
AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME  
TYPES OF COATING, MAKING REPLACEMENT OF THE COATING  
NECESSARY.

- A. All blanks, covers etc. must be removed from the items  
prior to cleaning and reassembled immediately afterwards.  
Items received in special cleaning containers should  
remain therein during the cleaning procedures unless  
otherwise stated.

TUBES - CONNECTION ON DUCT (HP COMPRESSOR CASE TO DIFFUSER  
CASE LOWER) TO SPHERICAL JOINT FLANGE - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00  
Cleaning for details of the cleaning processes referred  
to in Table 201.
- B. To ensure that all items within this breakdown that  
require cleaning and subsequent Inspection/Check are  
recognized, and identified by their Part Number, figures  
are provided which equate with the Illustrated Parts  
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with  
the relevant Figure and Item Number in the same breakdown  
in the I.P.C. Items illustrated in the I.P.C. which are  
not illustrated in this breakdown, are those items which  
are either discarded at overhaul, or are normally assembled  
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the  
figures, Table 201 does not list all items, but deals  
collectively with the items requiring the same cleaning  
process.
- D. On receipt of the items from disassembly, all protective  
blanks, covers etc. deemed necessary for the protection  
of the items will have been assembled and, in addition,  
many of the items will arrive in containers. Any special  
containers, blanks, covers etc. are listed in Table 202  
by their Tool Ref. No. e.g. (Tool 123). For the  
manufacturer's Part No. refer to the appropriate Table in  
Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items  
prior to cleaning and reassembled immediately afterwards.  
Items received in special cleaning containers should  
remain therein during the cleaning procedures unless  
otherwise stated.
- B. All items contained in this breakdown must be cleaned by  
the appropriate processes quoted in the table, to achieve  
a cleanliness to enable the Inspection/Check to be carried  
out correctly. Where alternative processes are quoted,  
the operator must decide what process to use depending on  
the amount of contamination of the item. Any item that is  
not cleaned satisfactorily must be recleaned by the  
appropriate process.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

TUBES - INTERMEDIATE CASE ELBOW DUCT TO SECOND STAGE  
PUMP - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00  
Cleaning for details of the cleaning processes referred  
to in Table 201.
- B. To ensure that all items within this breakdown that  
require cleaning and subsequent Inspection/Check are  
recognized, and identified by their Part Number, figures  
are provided which equate with the Illustrated Parts  
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with  
the relevant Figure and Item Number in the same breakdown  
in the I.P.C. Items illustrated in the I.P.C. which are  
not illustrated in this breakdown, are those items which  
are either discarded at overhaul, or are normally assembled  
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the  
figures, Table 201 does not list all items, but deals  
collectively with the items requiring the same cleaning  
process.
- D. On receipt of the items from disassembly, all protective  
blanks, covers etc. deemed necessary for the protection  
of the items will have been assembled and, in addition,  
many of the items will arrive in containers. Any special  
containers, blanks, covers etc. are listed in Table 202  
by their Tool Ref. No. e.g. (Tool 123). For the  
manufacturer's Part No. refer to the appropriate Table in  
Special Tools Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N,  
INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COM-  
PONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY  
COATINGS. THE NITRIC ACID USED IN PROCESSES J, L  
AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME  
TYPES OF COATING, MAKING REPLACEMENT OF THE COATING  
NECESSARY.

- A. All blanks, covers etc. must be removed from the items  
prior to cleaning and reassembled immediately afterwards.  
Items received in special cleaning containers should  
remain therein during the cleaning procedures unless  
otherwise stated.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

TUBE - CONNECTION ON TUBE (HP COMPRESSOR CASE TO DIFFUSER  
CASE LOWER) TO AIRCRAFT CONNECTION - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

ENGINE ANTI-ICING TUBES AND MANIFOLD - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

surface defects.

Reject.

9. Tubes (304-160, 305-110/220)

A. Inspect Tubes (Ref.72-09-00, Inspection/Check).

B. Inspect External Diameters of Sealing Ring Locations.

(1) Fretting.

(a) Not more than 0.010 in.  
(0,250 mm) deep.

Accept after  
repair.

(2) Scoring.

(a) Not more than 0.010 in.  
(0,250 mm) deep.

Accept after  
repair.

C. Inspect Bore of Sealing Ring Locations.

(1) Fretting.

(a) Not more than 0.005 in.  
(0.130 mm) deep.

Accept after  
repair.

(2) Scoring.

(a) Not more than 0.005 in.  
(0,130 mm) deep and not  
extending right across  
the face.

Accept after  
repair.

D. Inspect Retaining Plate Locations.

(1) Fretting and wear.

(a) Thickness reduced not  
more than 15 per cent.

Accept after  
repair.

## ENGINE ANTI-ICING MANIFOLD - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

AIR DUCT ASSEMBLY - SLEEVE BORE REPAIRED  
BY PLASMA SPRAY

MODIFICATION No. OL.8888C

1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
75-11-01	2 135	B.455109 B.479535

2. Introduction

A. General.

- (1) This repair describes the procedure for restoring the worn bore of the air duct assembly sleeve by plasma spray.
- (2) Dimensions are shown thus: INCHES (MILLIMETRES) in tables and illustrations.
- (3) Refer to Chapter 72-09-00 Repair, for all standard practices applicable to this repair procedure.
- (4) Remove sharp edges 0.004 to 0.020 in. (0,10 to 0,51 mm) unless otherwise stated.
- (5) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (6) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.
- (7) Surface texture is to be 125 micro-inches (3,2 micro-metres) unless otherwise stated.
- (8) All tools referred to by item number in procedural steps are detailed in para.4.
- (9) Protect the component against corrosion after each operation, and place in a container for protection against damage during transit between operations.

B. Repair Limitations.

- (1) Wear remaining in the bore after machining prior to plasma spray must not exceed 0.010 in. (0,25 mm) in depth.

### 3. Instructions

#### A. Machine.

- (1) Locate the sleeve on a grinding machine, and set true.
- (2) Grind the bore to achieve the 1.512/1.510 in. (38,40/38,35 mm) dimension. Refer to Repair Limitations in para.2.B(1), and Figure 401.
- (3) Remove burrs and sharp edges.

#### B. Inspect.

- (1) Inspect for the satisfactory completion of the machining operation.
- (2) Inspect for cracks using the fluorescent dye penetrant process F1A detailed in Chapter 72-09-00 Inspection/Check, or TSD 594 0P213.

#### C. Remove Corrosion.

NOTE: This operation applies to sleeve B.455109 only.

- (1) Remove any remaining corrosion as detailed in TSD 594 0P121.

#### D. Plasma Spray.

- (1) Degrease the sleeve using vapour or liquid degreasing, as instructed in TSD 594 0P704.
- (2) Mask off the areas not to be sprayed, as instructed in TSD 594 0P704.
- (3) Dry abrasive blast the areas to be sprayed, as instructed in TSD 594 0P704.
- (4) Plasma spray the sleeve bore with Metco 447NS (MSRR 9507/35) to a depth sufficient to achieve the final bore diameter of 1.5016/1.5000 in. (38,141/38,100 mm). Refer to TSD 594 0P704 and Figure 401.

E. Machine.

- (1) Locate the sleeve on a grinding machine and set true.
- (2) Grind the bore to achieve the finish machining dimensions given in Figure 401.
- (3) Remove burrs, sharp edges and overspray.

F. Inspect.

- (1) Inspect for the satisfactory completion of the machining operation.
- (2) Visually inspect the coating for cracking and lack of adhesion as instructed in TSD 594 OP704.

G. Apply Protective Coating.

NOTE: This operation applies to sleeve B455109 only.

- (1) Apply a seal coating of clear varnish (MSRR 9064) to the plasma spray coating as instructed in TSD 594 OP323.

H. Identify.

- (1) Mark SAL B.507088  or R1 adjacent to the existing part number using vibro-percussion engraving as instructed in Chapter 72-09-00 Repair.

J. Final Inspection.

- (1) Finally inspect the sleeve to ensure that the repair has been carried out satisfactorily, and that the sleeve is in a serviceable condition.

ANTI-ICING MANIFOLD NO.5 VANE DUCT ASSEMBLY - REPAIR  
REPAIR FRETTED SEAL HOUSING BY REPLACEMENT

MODIFICATION NO. OL.89631. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
75-11-01	1 10A	B455100

2. Introduction

## A. General.

- (1) This repair describes the procedure for replacement of a fretted Seal Housing on the anti-icing manifold No.5 Vane Duct Assembly.
- (2) Dimensions are shown thus, INCHES (MILLIMETRES), in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair, for all standard practices applicable to this repair procedure.
- (4) Remove all sharp edges 0.004 to 0.020 in. (0,10 to 0,50 mm) unless otherwise stated.
- (5) Tolerances on machined dimensions are plus/minus 0.010 in (0,25 mm) unless otherwise stated.
- (6) Tolerances on angles are plus/minus 2 degrees.
- (7) All welding and X-ray processes are to be in accordance with those laid down in TSD 594-409.

## B. Repair Limitations.

- (1) Compliance with all aspects of this repair should be achieved without deviation. Where a need to deviate is considered necessary then reference should be made to the Repair Authority.

3. Instructions

## A. Preparation.

- (1) Using hand tools only, and working at the waste (housing) side of the weld line, remove defective Seal Housing Part No. B455104 from Duct Part No. B455103. Discard defective housing.

REPAIR

**75-11-01**Repair No.2  
Page 401  
Apr 1/91

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Dress back duct end face to reproduce pre-weld conditions. Duct end face after preparation is to be square to the axis of the duct to within 0.0015 in. (0,038 mm).

NOTE: Thinning of duct wall is not acceptable.

- (3) Remove any burrs/sharp edges on duct joint face.
- (4) Referring to Figure 401, check dimensions of prepared duct and new seal housing.
- (5) Offer new seal housing to duct and ensure a clearance fit of 0.001 to 0.005 in. (0,003 to 0,13 mm). If necessary, using hand tools only, dress circumference of duct to obtain final fit.

B. Inspect.

- (1) Inspect the worked area of the duct for cracks using the fluorescent dye penetrant process specified for this component in Chapter 72-09-00, (Inspection).

C. Assemble.

- (1) Referring to TSD 594-409, prepare duct and new seal housing for welding.
- (2) Assemble new seal housing and duct (Ref. Fig. 401) and butt weld in position using mechanised Argon Arc procedure as specified in TSD 594-409.

D. Inspect.

- (1) Inspect the repaired area for cracks using the fluorescent dye penetrant process F1A as specified in Chapter 72-09-00, Inspection.
- (2) Inspect the repaired area using X-ray procedures specified in TSD 594-409 for weld classification Group 1.

E. Test.

- (1) Carry out pressure test of repaired duct assembly using water to a pressure of 75 p.s.i. for a minimum period of 15 seconds. No leaks are permissible.

F. Inspect.

- (1) Referring to Figure 401, inspect all dimensions and ensure correct.

## ENGINE ANTI-ICING TUBES - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

**CAUTION:** BEFORE USING HEAVY CLEANING PROCESSES J, L AND N, INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COMPONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY COATINGS. THE NITRIC ACID USED IN PROCESSES J, L AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME TYPES OF COATING, MAKING REPLACEMENT OF THE COATING NECESSARY.

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.

CLEANING

# 75-11-02

Page 201

OVERHAUL

- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

FIG. NO.	ITEM NO.	NOMENCLATURE	CLEANING PROCESSES		REMARKS

REPAIR OF FRETTING/DAMAGE BY INERT GAS ARC WELDING

REPAIR NO. B514567

1. EFFECTIVITY

IPC	Fig./Item	Part No.
75-11-02		B477653
	2/110A	B481899
	1/160B	B491619

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

Direct welding of fretting/damage is limited to a maximum depth of 50% of the gauge thickness of the individual tube.

Maximum size of repairable fret/damage mark to be contained within an envelope measuring 0.350 x 0.350 (8,90 x 8,90) (Refer fig.401).

This repair does not cover welding of fittings, which must be replaced to the appropriate repair instruction.

3. GENERAL

UNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)

Dimensions in Inches (Millimetres)

Tolerances on machined dimensions plus/minus 0.010 (0,25)

Tolerance on angles plus/minus 2 degrees

Break sharp edges 0.004 to 0.020 (0,1 to 0,5)

Surface texture interpretation to ISO1302 (JES137)

Surface texture to be 125 (3,2) Microinches (Micrometres)

Welding symbols to ISO2553 (JES139)

3rd Angle Projection

REPAIR OF TUBES BY REPLACEMENT OF DAMAGED SECTIONS

REPAIR NO. B514646

1. EFFECTIVITY

IPC	Fig./Item	Part No.
75-11-02		B477653
75-11-02	2/110A	B481899
75-11-02	1/160B	B491619

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

This Repair instruction covers repair of tubes damaged by fretting from pipe clips or other forms of damage.

Damage may be repaired according to the following basic requirements:-

Where edge of fretted area is not less than 1.650 (41,91) from commencement of a bend or curve the use of a 'tube joint' will normally be sufficient on 1.250 (31,75) diameter tube. Standard length to be used is L20, ie 2.000 (50,80) at clip positions. Refer figs.403, 404, 405, 406 and 407.

Where edge of fretted area is less than 1.650 (41,91) from commencement of a bend or curve, or damage is to a 2.000 (50,80) diameter tube this will require a new (or cannibalised) section of tube to be fitted with suitable tube joints and formed in accordance with a standard tube assembly (where applicable). Refer figs.402, 408, 409, 410 and 411.

A repair weld line must not occur in an area which will be covered by a clip. Refer fig.405.

Six lengths of tube joint B514643 are available for 1.250 (31,75) diameter tubes from L05 to L30 i.e 0.500(12,70) to 3.000 (76,20) in 0.500(12,70) increments.

Repair No. 3

Page 401

Jan 4/93

**OLYMPUS 593**

MK.610-14-28

OVERHAUL

Tube joints B514644 and B514645 are available for 2.000(50,80) diameter tubes. Tube joint B514645 should be used when replacing lengths of tube.

The use of 'Reel' type tube joints, shorter than the outside diameter of the tube being repaired, greatly increase the chance of distortion or collapse of the repair area. Wherever limitations permit, use 'Reel' type tube joints which are greater in length than the outside diameter of the tube or 'Tee' type tube joints with a make up tube length equal to or greater than the outside diameter of the tube.

## ENGINE ANTI-ICING AIR CONTROL VALVE - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

## ENGINE ANTI-ICING AIR PRESSURE SWITCH - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

## ENGINE CONTROLS - INSPECTION/CHECK

### 1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

### 2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

- A. Magnetic Particle Crack Detection.

(1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

## THROTTLE VALVE CONTROL ACTUATOR - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

LP COMPRESSOR RPM PROBE - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

PRIMARY NOZZLE CONTROL SIGNAL PITOT AND REHEAT PRESSURE  
DETECTOR CONNECTOR - DISASSEMBLY

1. General

- A. Before commencing the disassembly, refer to 72-09-00 Disassembly, for general information.
- B. The pitot is located on the spherical joint flange and is installed on the left or right-hand side depending on the engine position in the nacelle. The alternative location is used for the installation of the reheat pressure detector connector.
- C. Filters and a restrictor are retained in the pitot union by a circlip. The filters are withdrawn from the pitot union for inspection/check or renewal after pitot union removal from the engine (Ref.para.2.C.).
- D. The removal and installation of the primary nozzle control signal pitot and reheat pressure detector connector is also detailed in 72-53-00.

2. Disassemble the Signal Pitot (Ref.Fig.101)

- A. Remove Pitot.
  - (1) Remove wire-locking and unscrew tube union nut.
  - (2) Remove and discard the securing bolts, then remove the pitot union.
  - (3) Withdraw pitot from mounting on spherical joint flange.
- B. Disassemble Pitot Union, Restrictor and Filters.
  - (1) Extract circlip and remove loose items from the pitot union in the sequence shown.

3. Disassemble the Reheat Pressure Detector Connector (Ref.Fig.101)

- A. Remove Connector.
  - (1) Remove wire-locking.
  - (2) Unscrew tube union nut.
  - (3) Remove and discard the securing bolts, then remove the connector.

PRIMARY NOZZLE CONTROL SIGNAL PITOT AND REHEAT PRESSURE  
DETECTOR CONNECTOR - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 301-20 refers to Figure 301 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 301, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.3 onwards.

PRIMARY NOZZLE CONTROL SIGNAL PITOT AND REHEAT  
DETECTOR CONNECTOR - ASSEMBLY

1. General

- A. Before commencing the assembly, refer to 72-09-00 Assembly, for general information.
- B. The pitot is located on the spherical joint flange and is installed on the left or right-hand side depending on the engine position in the nacelle. The alternative location is used for the installation of the reheat pressure detector connector.
- C. Filters and a restrictor are retained in the pitot union by a circlip. The filters are withdrawn from the pitot union for inspection/check or renewal after pitot union removal from the engine (Ref. para.2.C.).
- D. The removal and installation of the primary nozzle control signal pitot and reheat pressure detector connector is also detailed in 72-53-00.
- E. During the assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) 76-21-01, to identify those items where the nomenclature does not positively identify them, due to the duplication of the title, e.g. nuts, bolts and washers etc. When the item is a part of the breakdown of the text concerned, the item will be identified as nut (1-10), the 1 referring to the I.P.C. Fig.No. and the 10 referring to the Item No.

2. Assemble the Signal Pitot (Ref. Fig.501)

- A. Assemble Pitot Union and Associated Loose Items.
  - (1) Insert spring and spring plate in pitot union.
  - (2) Place the restrictor between the two filters and insert the group in the pitot union against the spring plate.
  - (3) Verify that the assembly sequence has conformed to that shown in Figure 501 and install the retaining circlip.

B. Install Pitot and Pitot Union Assembly.

- (1) Apply lubricant B (Ref.70-00-01, Servicing and Storage Materials) to the tube union connections and lubricant C to two new securing bolts (1/10A).
- (2) Position the pitot in its location with the assembly pin engaging the locating hole at the mating faces.
- (3) Position union assembly on pitot and secure pitot and pitot union assembly with the two new bolts and torque-tighten to 100 lbf in. (11,5 N.m.).
- (4) Screw on tube union nut and torque-tighten to between 190 and 210 lbf in. (21,5 and 23,5 N.m.).
- (5) Wire-lock union nut and securing bolts together.

3. Assemble the Reheat Pressure Detector Connector (Ref. Fig.501)

A. Install connector.

- (1) Apply lubricant A to two new securing bolts (1/100A).
- (2) Position the connector on its location face and secure with the two new bolts. Torque-tighten to 100 lbf in. (11,5 N.m.).
- (3) Screw on tube union nut and torque-tighten to between 190 and 210 lbf in. (21,5 and 23,5 N.m.).
- (4) Wire-lock union nut and securing bolts together.

PRIMARY NOZZLE CONTROL SIGNAL PITOT AND REHEAT PRESSURE  
DETECTOR CONNECTOR - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

#### A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.
- (2) Items to be crack detected by this method are illustrated in the Crack Detection Test Diagram (Fig.301). For details of the processes, refer to 72-09-00 Inspection/Check.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS
---------	----------	-------------	---------

No current requirement

Items to be Magnetic Particle Crack Tested  
Table 301

#### B. Fluorescent Dye Crack Detection.

- (1) Submit the items listed in Table 302 to crack detection in accordance with the process quoted. For details of the processes, refer to 72-09-00 Inspection/Check.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS
---------	----------	-------------	---------

302	110	Base Plate	FlA
302	230	Cylinder	FlA
302	240	Piston	FlA
302	260	Catch Plate	FlA
303	110	Support Bracket	FlA
304	520	Actuator Shaft	FlA
		Retainer	FlA
304	570	Actuator Arm Shaft	FlA
304	580	Actuator Arm	FlA

Table 303

CAUTION: IF LP SHAFT SIGNAL SYSTEM CHOPPER MECHANISM HAS OPERATED DURING ENGINE RUN THE FOLLOWING COMPONENTS MUST BE REJECTED, FLANGED ADAPTERS (302-70/80), CABLE ASSEMBLY (302-100, 303-380, 304-150), BASE PLATE (302-110), CYLINDER (302-230), PISTON (302-240), SPRING (302-250), SHOULDERED PINS (303-370, 304-140), ACTUATOR ARM SHAFT (304-570) AND ACTUATOR ARM (304-580).

NOTE: Inspect all components related to the LP Shaft Signal System for compatibility. Ensure that all sliding assemblies function smoothly with the mating component and without any undue force.

4. Flanged Adapter Assembly (302-70/80)

A. Inspect Abutment Flanges.

- |  |                      |
|--|----------------------|
| (1) Nicks and burrs.   | Accept after repair. |
| (2) Wear.  |                      |
| (a) Not more than 10 per cent reduction in flange thickness. | Accept.              |

- (b) Bolt holes elongated not more than 0.030 in. (0,760 mm).

Accept after repair.

(3) Scores.

- (a) Not more than 0.010 in. (0,250 mm) in depth.

Accept after repair.

B. Inspect Shield Tube Location.

- (1) Nicks and burrs.

Accept after repair.

(2) Scores.

- (a) Not more than 0.010 in. (0,250 mm) in depth.

Accept after repair.

C. Inspect Split Guide Bushes.

- (1) Nicks and burrs.

Accept after repair.

(2) Wear.

- (a) Not more than 0.010 in. (0,250 mm) in guide bore.

Accept after repair.

NOTE: Where split bushes are removed for inspection they must be retained as a matched pair.

5. Shield Tube (302-90)

- A. Inspect Tube (Ref.72-09-00 Inspection/Check).

6. Cable Assembly (302-100, 303-380, 304-150)

- A. Inspect Threads (Ref.72-09-00 Inspection/Check).

- B. Inspect End Fittings.

OVERHAUL

(1) Security.

- (a) Any indication of defective swaging.

Reject.

(2) Nicks and burrs.

Accept after repair.

C. Inspect Shouldered Pin Locations.

(1) Wear.

- (a) Pin holes elongated not more than 0.025 in. (0,630 mm).

Accept after repair.

- (b) Slight witness mark.

Accept after repair.

D. Inspect Cable.

NOTE: The operating cables consist of seven strands each strand being made up of 14 wires.

(1) Damage.

- (a) Not more than 14 wires broken along the complete length of each cable.

Accept.

- (b) Wire flattening.

Accept.

(2) Wear.

- (a) Thinning of cable.

Accept subject to acceptance standard in (1)(a).

7. Base Plate (302-110)

A. Inspect Abutment Face.

(1) Nicks and burrs.

Accept after repair.

(2) Wear.

- |     |  |                      |
|-----|--|----------------------|
| (a) | Not more than 10 per cent reduction in flange thickness. | Accept.              |
| (b) | Bolt holes elongated not more than 0.030 in. (0,760 mm). | Accept after repair. |

(3) Scores.

- |     |  |                      |
|-----|--|----------------------|
| (a) | Not more than 0.010 in. (0,250 mm) in depth. | Accept after repair. |
|-----|--|----------------------|

B. Inspect Flanged Adapter Locating Recess.

(1) Scores.

- |     |   |                      |
|-----|---|----------------------|
| (a) | Not more than 0.010 in. (0,250 mm) of radial scoring.         | Accept after repair. |
| (b) | Not more than 0.010 in. (0,250 mm) in depth of axial scoring. | Accept after repair. |

C. Inspect External Diameter of Piston Spigot.

- |     |                  |                      |
|-----|------------------|----------------------|
| (1) | Nicks and burrs. | Accept after repair. |
|-----|------------------|----------------------|

D. Inspect Bore of Spigot.

(1) Scores.

- |     |  |                      |
|-----|--|----------------------|
| (a) | Not more than 0.010 in. (0,250 mm) in depth. | Accept after repair. |

(2) Wear.

- (a) Not more than 0.005 in.  
(0,130 mm) of diametric  
wear.

Accept after  
repair.

8. Sliding Guard Assembly (302-220)

A. Inspect Sliding Guard Assembly (Ref.72-09-00 Inspection/  
Check, Rigid Tubes).

B. Inspect Abutment Flange.

(1) Nicks and burrs.

Accept after  
repair.

(2) Wear.

- (a) Not more than 10 per cent  
reduction in flange  
thickness.

Accept after  
repair.

- (b) Bolt-holes elongated not  
more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

9. Cylinder (302-230)

A. Inspect Abutment Flange.

(1) Nicks and burrs.

Accept after  
repair.

(2) Wear.

- (a) Not more than 10 per cent  
reduction of flange  
thickness.

Accept after  
repair.

- (b) Bolt-holes elongated not  
more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

B. Inspect Cylinder Bore.

- (1) Nicks and burrs. Accept after repair.
- (2) Scores. Accept after repair if compatibility is unimpaired.
  - (a) Not more than 0.010 in. (0,250 mm) deep.
- (3) Wear. Accept.
  - (a) Smooth unstepped wear.
  - (b) Stepped wear. Accept after repair providing material thickness is not reduced by more than 20 per cent.

C. Inspect Piston Shaft Diameter of Cylinder Bore.

- (1) Nicks and burrs. Accept after repair.
- (2) Scores. Accept after repair if compatibility is unimpaired.
  - (a) Not more than 0.010 in. (0,250 mm) deep.
- (3) Wear. Accept.
  - (a) Not more than 0.010 in. (0,250 mm) on diameter.

D. Inspect Spring Stop Flange in Cylinder Bore.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear. Accept.
  - (a) Not more than 0.010 in. (0,250 mm) in depth.

## B. Inspect Spring Location Flange.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear.
  - (a) Not more than 0.010 in. Accept after repair.  
(0,250 mm) in depth.

## C. Inspect Nut and Retaining Ring Location.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear.
  - (a) Not more than 0.010 in. Accept after repair.  
(0,250 mm) in depth.

11. Spring (302-250)

## A. Inspect Spring.

- (1) Check spring compression load. Use spring test equipment (Ref.72-09-00 Inspection/Check).
  - (a) Free length Accept.  
5.000 in.  $\pm$  0.045 in.  
(127,000 mm  $\pm$  1,143 mm).
  - (b) Installed length is 4.200 in. Accept.  
(96,680 mm).
  - (c) Load at installed length Accept.  
14.500  $\pm$  0.750 lb  
(6,575 kg  $\pm$  0,338 kg).
- (2) Wear.
  - (a) Flats on spring coil Accept.  
not more than 0.030 in.  
(0,760 mm) in depth.

OVERHAUL

12. Catch Plate (302-260)

A. Inspect Catch Plate.

- (1) Nicks and burrs.

Accept after  
repair.

13. Fixed Guard (302-310)

A. Inspect Abutment Flanges.

- (1) Nicks and burrs.

Accept after  
repair.

- (2) Wear.

- (a) Not more than 10 per cent  
reduction in flange  
thickness.

Accept after repair  
providing compati-  
bility is unim-  
paired.

- (b) Bolt holes elongated not  
more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

B. Inspect Sliding Guard Locating Spigot.

- (1) Nicks and burrs.

Accept after  
repair.

- (2) Wear.

- (a) Not more than 0.010 in.  
(0,250 mm) in depth.

Accept after  
repair.

14. Conduit (303-50/200/340)

A. Inspect Conduits (Ref.72-09-00 Inspection/Check, Rigid  
Tubes).

B. Inspect Strap Locations.

- (1) Wear.

- (a) Not more than 10 per cent  
reduction in material  
thickness.

Accept after  
repair.

(2) Nicks, burrs and scoring.

(a) Not more than 0.010 in.  
(0,250 mm) deep.

Accept after  
repair.

(3) Distortion.

(a) Any distortion.

Accept providing  
compatibility is  
unimpaired.

# 15. Cover (303-60/80)

A. Inspect Cover.

(1) Nicks and burrs.

Accept after  
repair.

(2) Wear.

(a) Not more than 10 per cent  
reduction in flange  
thickness.

Accept after  
repair.

(b) Bolt-holes elongated not  
more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

# 16. Support Bracket (303-110)

A. Inspect Support Bracket.

(1) Nicks and burrs.

Accept after  
repair.

(2) Wear.

(a) Not more than 10 per cent  
reduction in flange  
thickness.

Accept after  
repair.

- (b) Bolt-holes elongated not more than 0.030 in. (0,760 mm).

Accept after repair.

(3) Distortion.

- (a) Any distortion.

Accept after repair providing repair does not induce cracking and compatibility is preserved.

17. Block Assembly (303-140/210) and Roller Carrier (304-70)

A. Inspect Cable Lead-out Spigots.

- (1) Nicks and burrs.

Accept after repair.

- (2) Wear.

- (a) Not more than 0.010 in. (0,250 mm) deep in cable groove.

Accept after repair.

- (3) Scores.

- (a) Not more than 0.010 in. (0,250 mm) deep.

Accept after repair.

B. Inspect Roller Locations.

- (1) Nicks and burrs.

Accept after repair.

- (2) Wear.

- (a) Slight witness mark inside block.

Accept.

- (b) Not more than 0.010 in. (0,250 mm) elongation of shoulder pin holes.

Accept after repair.

more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

C. Inspect General Condition of Block Assembly.

- (1) Nicks and burrs.

Accept after  
repair.

D. Inspect Captive Nut (Ref.72-09-00 Inspection/Check).

18. Roller and Grooved Roller (303-180/190/280/290, 304-100)

A. Inspect Rollers.

- (1) Nicks and burrs.

Accept after  
repair.

- (2) Wear.

- (a) Elongation of shoulder  
pin holes not more than  
0.010 in. (0,250 mm).

Accept after  
repair.

- (b) Any witness mark of  
cable on roller.

Accept.

- (3) Scores.

- (a) Not more than 0.010 in.  
(0,250 mm).

Accept after  
repair.

19. Shoulder Pin (303-170/270/370, 304-140) and Grooved Shoulder  
Pin (309-90)

A. Inspect Shoulder Pins (303-170/270 and 304-90).

- (1) Nicks and burrs.

Accept after  
repair.

- (2) Wear.

- (a) Any witness mark.

Accept.

LP SHAFT SIGNAL SYSTEM - CYLINDER PISTON SECTION WITH  
FRONT AND CENTRE CABLE ASSEMBLIES - DISASSEMBLY

1. General

- A. Before commencing the disassembly, refer to 72-09-00 Disassembly, for general information.
- B. Throughout the text, special tools are quoted by their reference number; e.g. Tool 1234. For a complete list of tooling required for disassembly and for the Manufacturers Part Number, refer to Special Tools, Fixtures and Equipment, Table 1001.

2. Disassembly of the Cylinder Piston Assembly

- A. Disassemble the Guards (Ref.Fig.101).
- (1) Remove the nut and bolt securing the clip on the sliding guard and then withdraw the sliding guard together with the fixed guard away from the cylinder and centre cable.
  - (2) Remove the two nuts and bolts securing the fixed guard to the sliding guard. Separate the two guards and remove the clip.
- B. Disassemble the Cylinder and Piston Assemblies (Ref.Fig.102).
- (1) Remove the bolt and washer securing the strap to the cylinder and remove the strap.
  - (2) Install the assembly tool (Tool 1299) on the cylinder.

CAUTION: DO NOT UNSCREW THE BASEPLATE NUTS AND BOLTS UNLESS THE ASSEMBLY TOOL IS INSTALLED AND THE SPRING TENSION IS RELIEVED.

- (a) Screw the nut on the thrust screw towards the small tommy bar end using the large tommy bar.
- (b) Install the base of the tool onto the cylinder and using the small tommy bar, screw the thrust screw into the piston nut.

(c) Hold the base and small tommy bar steady. Using the large tommy bar, screw away from the small tommy bar. This action will tend to pull the piston towards the cylinder head and so compress the spring.

- (3) Remove the three nuts and bolts securing the cylinder to the baseplate.
- (4) Remove the tool by unscrewing the large tommy bar towards the small tommy bar until the spring pressure is relieved, then unscrew the thrust screw from the piston using the small tommy bar.
- (5) Separate the cylinder and spring from the piston.
- (6) Remove the retaining ring securing the nut to the piston and remove the nut.
- (7) Remove the nut securing the catch plate and remove the baseplate.

C. Disassemble the Shield Tube Assembly (Ref.Fig.103).

- (1) Remove the nut and bolt securing the loop clamp.
- (2) Move the rear adapter away from the shield tube and then remove the rear spring pin securing the bush guide halves. Remove the bush guides from the adapter.
- (3) Remove the rear adapter from the cable.
- (4) Withdraw the shield tube from the cable.
- (5) Remove the front spring pin securing the bush guide halves and then remove the bush guides from the front adapter.
- (6) Remove the front adapter from the cable.

OVERHAUL

CYLINDER PISTON SECTION, WITH FRONT AND CENTRE  
CABLE ASSEMBLIES - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00  
Cleaning for details of the cleaning processes referred  
to in Table 201.
- B. To ensure that all items within this breakdown that  
require cleaning and subsequent Inspection/Check are  
recognized, and identified by their Part Number, figures  
are provided which equate with the Illustrated Parts  
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with  
the relevant Figure and Item Number in the same breakdown  
in the I.P.C. Items illustrated in the I.P.C. which are  
not illustrated in this breakdown, are those items which  
are either discarded at overhaul, or are normally assembled  
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the  
figures, Table 201 does not list all items, but deals  
collectively with the items requiring the same cleaning  
process.
- D. On receipt of the items from disassembly, all protective  
blanks, covers etc. deemed necessary for the protection  
of the items will have been assembled and, in addition,  
many of the items will arrive in containers. Any special  
containers, blanks, covers etc. are listed in Table 202  
by their Tool Ref. No. e.g. (Tool 123). For the  
manufacturer's Part No. refer to the appropriate Table in  
Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items  
prior to cleaning and reassembled immediately afterwards.  
Items received in special cleaning containers should  
remain therein during the cleaning procedures unless  
otherwise stated.
- B. All items contained in this breakdown must be cleaned by  
the appropriate processes quoted in the table, to achieve  
a cleanliness to enable the Inspection/Check to be carried  
out correctly. Where alternative processes are quoted,  
the operator must decide what process to use depending on  
the amount of contamination of the item. Any item that is  
not cleaned satisfactorily must be recleaned by the  
appropriate process.

CLEANING

76-21-01

Page 201

Jan 1/77

OLYMPUS 593

MK.610-14-28

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

LP SHAFT SIGNAL SYSTEM - CYLINDER PISTON SECTION  
WITH FRONT AND CENTRE CABLE ASSEMBLIES -  
INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.

INSPECTION/CHECK

**76-21-01**

B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

#### A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.
- (2) Items to be crack detected by this method are illustrated in the Crack Detection Test Diagram (Fig.301). For details of the processes, refer to 72-09-00 Inspection/Check.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS

LP SHAFT SIGNAL SYSTEM - REPAIR OF BLOCK BY  
RESTORATION OF ROLLER PIN LOCATION HOLES

MODIFICATION NO. OL.8642C

1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part No.</u>
76-21-01	2 140A	B.395528

2. Introduction

A. General.

- (1) This repair describes the procedure for restoring the block roller pin location holes to their original standard.
- (2) The worn holes are filled with weld, then after suitable inspection and heat treatment are re-produced by drilling and their adjacent faces machined to basic drawing requirements.
- (3) Dimensions are shown thus in tables and illustrations: INCHES (MILLIMETRES).
- (4) Refer to Chapter 72-09-00 Repair, for all Standard Practices applicable to this repair procedure.
- (5) Details of the tools, referred to by item number in this repair procedure, can be found in para.4.
- (6) Remove all sharp edges 0.004 in. to 0.020 in. (0,1 mm to 0,5 mm) unless otherwise stated.
- (7) The tolerance on machined dimensions is plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (8) The tolerance on angles is plus/minus 2 degrees unless otherwise stated.

- (9) To avoid damage, ensure the block is placed in a suitable protective container during transit between operations.

### 3. Instructions

#### A. Weld-fill Defective Holes.

- (1) Clean the areas to be welded using clean, fine grade Scotchbrite and degrease with Genklene.
- (2) Locate the block in fixture, ref. tool item 1 (Fig.401) and fill the six 0.1567 in./0.1562 in. (3,98 mm/3,97 mm) diameter holes with weld (Fig.402); refer to para.6, Process A for manual welding recommendations.
- (3) Reverse the block in the fixture and repeat operations (1) and (2).

#### B. Inspect and Heat Treat.

- (1) Test the block for cracks using the magnetic particle examination method detailed in Chapter 72-09-00, Inspection/Check; refer to Fig.403 for test diagram.
- (2) Place the block in a furnace and heat treat to 650 deg.C. plus/minus 5 deg.C. for 1 hour. Cool in air.
- (3) Check the block for distortion. If necessary, true-up the block using conventional workshop tools. Care must be taken not to damage the block.
- (4) Repeat the test for cracks using the method detailed at para.(1).

#### C. Machine Block.

- (1) Locate the block in fixture, ref. tool item 2 (Fig.401).
- (2) Locate the block/fixture assy. to a suitable milling machine, and mill to produce the 0.306 in./0.300 in. (7,77 mm/7,62 mm) wide slot, then mill to produce the 0.450 in./0.438 in. (11,43 mm/11,13 mm) overall width (Fig.404).

- (3) Remove the block from fixture.
- (4) Locate the block in drill jig, ref. tool item 3 (Fig.401).
- (5) Locate the block/drill jig assy. to a suitable drilling machine, and reproduce the six 0.1567 in./0.1562 in. (3,980 mm/3,967 mm) diameter holes. Chamfer the holes 0.030 in./0.020 in. (0,76 mm/0,51 mm) x 45 degrees both sides (Fig.402).
- (6) Remove the block from drill jig.
- (7) Remove burrs using conventional hand tools.

D. Inspect and Identify.

- (1) Check the block for cracks using the magnetic particle examination method detailed in Chapter 72-09-00, Inspection/Check; refer to Fig.403 for test diagram.
- (2) Mark the repair scheme number B.495641, or R1 adjacent to the standard part number; use the electro-chemical engraving method (Ref.72-09-00, Repair).
- (3) Finally inspect the block to ensure the repair has been carried out satisfactorily and that the block is in a serviceable condition.
- (4) Generally clean the block to remove grease and foreign bodies, then place in a suitable protection container.

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary reference should be made to the Repair authority for agreement.

Work to either PART A or B of this repair depending on type and position of fretting/wear:-

PART A: Blending of fretting over area AA. Refer fig.401.  
Maximum blend depth 0.020(0,51) provided minimum wall section is not less than 0.047(1,19).

PART B: Repair Piston end wear, over area AB by flame spraying, Refer fig.401. Minimum repairable diameter 1.273(32,33).

#### 4. REPAIR PROCEDURE

##### REPAIR PROCEDURE

##### SUPPLEMENTARY INFORMATION

###### PART A:

- 1) Visually inspect to verify position of fretting on area AA. Refer fig.401
- 2) Using conventional hand tools only, blend to remove fretting. Produce a smooth and continuous profile, removing only the minimum of material.
- 3) Dimensionally inspect to ensure repair limitations have not been exceeded. Refer REPAIR LIMITATIONS and fig.401
- 4) Inspect for cracking. Refer Overhaul Manual Chapter 76-21-01 Inspection/Check.
- 5) Mark SAL.B513491 'A' or R3 adjacent to existing part number using the vibro-percussion engraving. Refer Overhaul Manual Chapter 72-09-00 Repair.

###### PART B:

- 1) Visually inspect to verify position and extent of wear to area AB. Refer fig.401
- 2) Set component on a lathe and set true to datum A. Machine to dimensions shown. Refer fig.401
- 3) Dimensionally inspect repair area. Refer fig.401
- 4) Crack detect repair area. Refer Overhaul Manual, Chapter 76-21-01. Inspection/Check
- 5) Mask off areas not to be coated. Refer fig.401
- 6) Apply bond coat to a thickness of 0.003/0.005(0,07/0,13). Refer TSD 594 OP 704. Bond coat MSRR9507/5 Metco 450 NS.

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

This repair is applicable to both conduit ends of the component and may be restored together or individually as required.

This repair may be embodied any number of times provided stated dimensions are maintained.

3. GENERAL

UNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)

LP SHAFT SIGNAL SYSTEM - CYLINDER AND PISTON SECTION  
WITH FRONT AND CENTRE CABLE ASSEMBLIES - ASSEMBLY

1. General

- A. Before commencing the assembly refer to 72-09-00 Assembly, for general information.
- B. Throughout the text, special tools are quoted by their reference number; e.g. Tool 1234. For a complete list of tooling required for assembly and for the Manufacturer's Part Number, refer to Special Tools, Fixtures and Equipment, Table 1002.
- C. During the assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) 76-21-01, to identify those items where the nomenclature does not positively identify them, due to the duplication of the title, e.g. nuts, bolts and washers etc. When the item is a part of the breakdown of the text concerned, the item will be identified as nut (1-10), the 1 referring to the I.P.C. Fig.No. and the 10 referring to the Item No.

2. Assemble the Cable to the Flanged Adapter Assemblies and Shield (Ref.Fig.501)

A. Prepare the Cables.

- (1) Immerse the front and centre cables in lubricant 'T', allow to soak and then drip dry.

B. Assemble the Front Adapter to the Cable Assembly.

- (1) Insert the cable (1-100A), dump valve end first, through the front adapter (1-70).
- (2) Assemble the bush guide halves (1-75-79) over the cable and insert into the adapter. Align the slot in the bush half with the adapter slot.

OVERHAUL

- (3) Retain the bush guide halves in position by inserting the spring pin into the adapter.
- (4) Slide the shield tube (1-90) (S.B.76-8 standard) over the cable and the adapter and align the slots. Install the loop-clamp (1-20) on the shield tube.

C. Assemble the Rear Adapter to the Cable Assembly.

- (1) Slide the adapter (1-80) over the cable.
- (2) Assemble the bush guide halves over the cable and insert into the adapter and align the guide halves.
- (3) Retain the bush guide in position by inserting the spring pin into the adapter.
- (4) Assemble the adapter (1-80) to the shield tube and install the retaining ring (1-40).
- (5) Secure the adapter (1-80) to the shield tube with the loop-clamp (1-20), bolt (1-30) and nut (1-10). Lubricate the threads with lubricant 'B' then ensuring that the locking (run-down) torque is a minimum of 3.5 lbf in. (0,4 N.m) torque-tighten the nut to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

3. Assemble Piston to Cylinder

A. Assemble the Front Cable and Catch Plate to the Piston (Ref.Fig.502).

- (1) Coat the bore of the baseplate (1-110) with lubricant 'G'.
- (2) Slide the baseplate over the cable and temporarily secure to the adapter (1-80) with three bolts (1-60) and nuts (1-50).
- (3) Install the nut (1-300) on the piston (1-240) and secure in position with the retaining ring (1-290).

OVERHAUL

- (4) Slide the piston over the cable and using the slot in the piston, position the catchplate (1-260) and secure with the nut (1-270). Apply lubricant 'B' to threads of nut then ensuring that the locking (run-down) torque is a minimum of 3.5 lbf in. (0,4 N.m) torque-tighten the nut to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

**B. Assemble the Piston to the Cylinder (Ref.Fig.503).**

- (1) Coat the outside diameter of the piston and the inside diameter of the cylinder (1-230) with lubricant 'G'.
- (2) Remove the nuts and bolts temporarily used to secure the baseplate to the adapter.
- (3) Slide the spring (1-250) and the cylinder (1-230) over the piston and using the assembly tool (Tool 1299), centralize and compress the spring as follows:
  - (a) Screw the nut on the thrust screw towards the small tommy bar end using the large tommy bar.
  - (b) Install the base of the tool onto the cylinder and using the small tommy bar, screw the thrust screw into the piston nut.
  - (c) Hold the base and small tommy bar steady. Using the large tommy bar, screw away from the small tommy bar. This action will tend to pull the piston towards the cylinder head and so compress the spring.
- (4) Secure the adapter, baseplate and cylinder together with three bolts (1-60) and nuts (1-50). Apply lubricant 'B' to the threads then ensuring that the locking (run-down) torque is a minimum of 3.5 lbf in. (0,4 N.m) torque-tighten the nuts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

SNECMA

- (5) Remove the tool by unscrewing the large tommy bar towards the small tommy bar until the spring pressure is relieved then unscrew the thrust screw from the piston nut using the small tommy bar.
- (6) Assemble the strap (1-120) to the cylinder and ensure the dog positions correctly. Secure with a washer (1-140) and bolt (1-130). Apply lubricant 'A' to the threads then ensuring that the locking (run-down) torque is a minimum of 2.0 lbf in. (0,23 N.m) torque-tighten the bolt to 40 lbf in. (4,5 N.m).

C. Assemble the Guards to the Cylinder (Ref. Fig.504).

- (1) Install the locknut (1-280) on the centre cable assembly (2-380) and screw the cable end into the piston nut.
- (2) Assemble the fixed guard (1-310) to the sliding guard (1-220) and secure together with two bolts (1-210) and nuts (1-200). Coat the threads with lubricant 'B' then ensuring that the locking (run-down) torque is a minimum of 2.0 lbf in. (0,23 N.m) torque-tighten the nuts to between 28 and 32 lbf in. (3,2 and 3,6 N.m).
- (3) Assemble the clip (1-190) and the guards on the cable and on the cylinder.
- (4) Secure the sliding guard to the cylinder using the clip, bolt (1-180) and nut (1-170). Coat the threads with lubricant 'A' then ensuring that the locking (run-down) torque is a minimum of 3.5 lbf in. (0,4 N.m), torque-tighten the nut to 100 lbf in. (11,5 N.m).

LP SHAFT SIGNAL SYSTEM - CYLINDER PISTON SECTION WITH  
FRONT AND CENTRE CABLE ASSEMBLIES - SPECIAL TOOLS,  
FIXTURES AND EQUIPMENT

1. General

- A. The special tools, fixtures and equipment listed in Table 1001 and 1002 are those required to disassemble and assemble the cylinder piston assembly.
- B. The tools have been listed in order of usage and the Tool Ref.No. is the number quoted in the text. Tools marked with an \* are used in more than one aspect of the overhaul and will be duplicated in the tables.
- C. The tools have been illustrated in order of usage but tools used in more than one aspect of overhaul will be illustrated once. Additional illustrations of tooling in operation (as thought necessary), are included in the text in the appropriate section.

## LP SHAFT SIGNAL SYSTEM - REAR CABLE ASSEMBLY - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

CLEANING

76-21-02

Page 201

Jun 1/96

OLYMPUS 593

MK.610-14-28

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

LP SHAFT SIGNAL SYSTEM - REAR CABLE ASSEMBLY -  
INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.

INSPECTION/CHECK

**76-21-02**

Page 301

B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

#### A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.
- (2) Items to be crack detected by this method are illustrated in the Crack Detection Test Diagram (Fig.301). For details of the processes, refer to 72-09-00 Inspection/Check.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS

CAUTION: IF LP SHAFT SIGNAL SYSTEM HAS OPERATED DURING  
ENGINE RUN THE FOLLOWING COMPONENTS MUST BE  
REJECTED, CABLE ASSEMBLY (302-150), SHOULDERED  
PINS (302-140), ACTUATOR ARM SHAFT (302-570) AND  
ACTUATOR ARM (302-580).

NOTE: Inspect all components related to the LP Shaft Signal  
System for compatibility. Ensure that all sliding  
assemblies function smoothly with the mating component  
and without any undue force.

4. Cable Assembly (302-150)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect End Fittings.

(1) Security.

(a) Any indication of defective swaging.	Reject.
---	---------

(2) Nicks and burrs.	Accept after repair.

## C. Inspect Shouldered Pin Locations.

## (1) Wear.

(a) Pin holes elongated not more than 0.025 in. (0,630 mm).	Accept.
---	---------

(b) Slight witness mark.	Accept.
--------------------------	---------

## D. Inspect Cable.

NOTE: The operating cables consist of seven strands each strand being made up of 14 wires.

(1) Any broken wires.	Reject.
-----------------------	---------

(2) Any wire flattening.	Reject.
--------------------------	---------

(3) Any polishing of cables without noticeable flattening.	Accept.
--	---------

5. Bracket (302-45)

## A. Inspect Bracket.

(1) Nicks and burrs.	Accept after repair.
----------------------	----------------------

## (2) Wear.

(a) Not more than 10 per cent reduction in flange thickness.	Accept.
--	---------

(b) Bolt-holes elongated not more than 0.030 in. (0,760 mm).	Accept.
--	---------

(3) Distortion.

Accept after repair  
providing compati-  
bility is preserved  
and repair does not  
induce cracking.

6. Bracket (302-190)

A. Inspect Bracket.

(1) Nicks and burrs.

Accept after  
repair.

(2) Wear.

(a) Not more than 10 per cent  
reduction in flange  
thickness.

Accept.

(b) Bolt-holes elongated not  
more than 0.030 in.  
(0,760 mm).

Accept.

7. Adjusting Washer (302-200)

NOTE: This is a select item on assembly.

A. Inspect Adjusting Washer.

(1) Nicks and burrs.

Accept after  
repair.

(2) Wear.

(a) Any longitudinal wear.

Reject.

(b) Bolt holes elongated not  
more than 0.030 in.  
(0,760 mm).

Accept.

8. Special Bolt (302-490)

A. Inspect Bolt Head.

(1) Wear.

(a) Not more than 0.030 in.  
(0,760 mm) of smooth  
unstepped wear.

Accept.

9. Actuator Shaft Retainer (302-520)

A. Inspect Actuator Shaft Retainer.

(1) Nicks and burrs.

Accept after  
repair.

(2) Scores.

(a) Not more than 0.005 in.  
(0,130 mm) in depth  
on sealing face.

Accept after repair  
providing sealing  
capabilities are  
unimpaired.

(3) Wear.

(a) Slight witness mark in  
bore and outside  
diameter of spigot.

Accept.

10. Sleeve (302-560) (SB.76-2 Part 2 only)

A. Inspect Sleeve.

(1) Nicks and burrs.

Accept after  
repair.

## ENGINE INDICATION - INSPECTION/CHECK

### 1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When an item is defined as being 'Acceptable after repair', rectify the defect in accordance with Standard Practices (Ref.72-09-00) and the equivalent Repair chapter. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

### 2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

- A. Magnetic Particle Crack Detection.

(1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

**77-10-00**

4. Tube Assembly (302-180)

- A. Inspect Tubes (Ref.72-09-00, Inspection/Check).
- B. Inspect Threads, Union Nuts and Thrust Wires (Ref. 72-09-00, Inspection/Check).
- C. Inspect Mounting Brackets.

(1) Wear and fretting.

- (a) Bolt-holes elongated  
not more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

(2) Nicks and burrs.

Accept after  
repair.

5. Pitot Assemblies - 4 Off (302-210)

- A. Inspect Threads and Insert (Ref.72-09-00, Inspection/Check).
- B. Inspect Probe.
  - (1) Bore or orifice obstructed.

Reject for re-  
cleaning.

INSPECTION/CHECK

77-10-00

OVERHAUL

C. Inspect Attachment Flange Faces.

- (1) Nicks, burrs and scores.

Accept, if repair  
preserves surface  
flatness.

D. Inspect Locating Diameter.

- (1) Nicks and burrs.

Accept, if repair  
preserves profile.

6. Brackets - 2 Off (302-230)

A. Inspect Brackets.

- (1) Distortion.

Accept, if repair  
preserves profile  
without cracking.

- (2) Wear and fretting.

- (a) Bolt-holes elongated  
not more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

- (3) Nicks and burrs.

Accept after  
repair.

7. Thermocouple Harness Assembly (303-10)

- A. Inspect in accordance with the vendor's Overhaul Manual  
(Ref.OH 77-20-34).

8. Jet Pipe Thermocouple Lead-out and Junction Box (304-70)

- A. Inspect in accordance with the vendor's Overhaul Manual  
(Ref.OH 77-20-34).

9. Turbine Cooling Air Thermocouples - 2 Off (305-10)

- A. Inspect in accordance with the vendor's Overhaul Manual  
(Ref.OH 77-20-31).

10. Lead-out and Junction Box Assemblies (306-140/160)

- A. Inspect in accordance with the vendor's Overhaul Manual  
(Ref.OH 77-20-31).

INSPECTION/CHECK

11. LP and HP Turbine Bearing Cold Air Vent Thermocouple Lead-out and Junction Box (307-10)
  - A. Inspect in accordance with the vendor's Overhaul Manual (Ref.OH 77-20-32).
12. LP Turbine Bearing Hot Vent Thermocouple Lead-out and Junction Box (308-50)
  - A. Inspect in accordance with the vendor's Overhaul Manual (Ref.OH 77-20-32).
13. Intermediate Case Bearings Cold Vent Thermocouple Lead-out and Junction Box (309-120)
  - A. Inspect in accordance with the vendor's Overhaul Manual (Ref.OH 77-20-33).
14. HP Compressor Rear Labyrinth Seal Hot Vent Thermocouple Lead-out and Junction Box (310-90)
  - A. Inspect in accordance with the vendor's Overhaul Manual (Ref.OH 77-20-33).
15. Junction Box Cover (311-10A, B or C) and Mounting Plate (311-60A or B)
  - A. Inspect Captive Nuts and Retainers (Ref.72-09-00, Inspection/Check).
  - B. Inspect Cover and Plate.
    - (1) Distortion. Accept, if repairable without cracking.
    - (2) Wear and fretting.
      - (a) Bolt-holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.
16. HP Compressor Delivery Air Thermocouple Lead-out and Junction Box (312-160)
  - A. Inspect in accordance with the vendor's Overhaul Manual (Ref.OH 77-20-32).

OVERHAUL

17. Oil Inlet and Outlet Thermometers (313-10 and 40)

- A. Inspect in accordance with the vendor's Overhaul Manual (Ref.OH 31-09-41/93).

18. Engine Vibration Transducer Cable (314-200)

NOTE: This cable must be severed during removal and is replaced during assembly (Ref.77-22-01, Assembly).

19. Bracket (314-90)

- A. Inspect Bracket.

(1) Wear and fretting.

(a) Attachment face thickness reduced by not more than 5 per cent. Accept.

(b) Bolt-holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

(2) Scoring.

(a) Not more than 0.010 in. (0,250 mm) in depth. Accept after repair providing material thickness is not reduced by more than 5 per cent.

(3) Nicks and burrs. Accept after repair.

(4) Distortion. Accept if compatibility is preserved.

20. Inner and Outer Glands (314-100/110)

- A. Inspect Glands.

(1) Compatibility. Assemble gland with bracket (314-90); secure temporarily.

(a) Cable holes misaligned. Reject.

(2) Nicks and burrs. Accept after repair.

## ENGINE POWER PITOTS - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

MK.610-14-28  
OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

ENGINE POWER PITOTS - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

#### A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.
- (2) Items to be crack detected by this method are illustrated in the Crack Detection Test Diagram (Fig.301). For details of the processes, refer to 72-09-00 Inspection/Check.

## OLYMPUS 593 OVERHAUL MANUAL

Temporary Revision No. 77-501

Insert in 77-12-03 after page 306

This TR is the first RST for section 77-12-03

### REASON FOR ISSUE:

To repair a cracked lug or replace a broken lug as applicable.  
(MRA 117).

### ACTION

B.E.O.L. REPAIR

RST 4025 ADAPTOR UNION: REPAIR  
OF CRACKED LUG OR REPLACEMENT OF  
BROKEN LUG BY ARGON ARC WELDING.

### PROCEDURE

This repair scheme is in two parts:

PART 1. Covers a cracked lug which may be welded and dressed  
back to original contours.

PART 2. Covers the replacement of a broken lug.

#### PART 1.

1. Cold straighten lug to original position.
2. Clean and prepare crack area for welding in accordance with  
TSD 594/Op.407.
3. Argon Arc weld crack using filler rod (see weld data sheet 2)  
as per TSD 594/Op.407.
4. Crack detect as per standard practices manual 72-20-10.
5. Dress lug back to original contours as per fig. 1. sheet 3.
6. Visually inspect.
7. Vibro engrave RST 4025/1 adjacent to Part No.

#### PART 2.

1. Machine or hand dress to dimensions indicated in Fig.2.
2. Produce new lug to conform to Fig.1 dimensions.

1 May 1981

TR.77-501  
77-12-03  
RST 4025  
TR. Page 1 of 3

**British airways**  
CONCORDE

TR.NO. 77-501 (cont'd)

3. Match new lug to adaptor union to give a good fit.
4. Prepare new lug and lug location for welding per TSD 594 - 407.
5. Argon Arc weld lug in position using filler rod (see weld data below) as per TSD 594 - 407.
6. Crack detect as per standard practices manual 72-20-10.
7. Machine and hand dress lug to conform to dimensions shown Fig.1.
8. Crack detect as per Op.6.
9. Vibro engrave RST 4025/2 adjacent to Part No.
10. Final inspect.

## ENGINE TEMPERATURE INDICATION - INSPECTION/CHECK

### 1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

### 2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

## JET PIPE THERMOCOUPLES - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

## ENGINE VIBRATION INDICATION - INSPECTION/CHECK

### 1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

### 2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

#### A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.
- (2) Items to be crack detected by this method are illustrated in the Crack Detection Test Diagram (Fig.301). For details of the processes, refer to 72-09-00 Inspection/Check.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS
---------	----------	-------------	---------

No current requirement

Items to be Magnetic Particle Crack Tested  
Table 301

#### B. Fluorescent Dye Crack Detection.

- (1) Submit the items listed in Table 302 to crack detection in accordance with the process quoted. For details of the processes, refer to 72-09-00 Inspection/Check.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS

4. Engine Vibration Transducer Cable (302-200)

NOTE: This cable must be severed during removal and is renewed during assembly (Ref.77-33-01, Assembly).

5. Bracket (302-90)

A. Inspect Bracket.

(1) Wear and fretting.

- |  |                      |
|--|----------------------|
| (a) Attachment face thickness reduced by not more than 5 per cent. | Accept.              |
| (b) Bolt-holes elongated not more than 0.030 in. (0,760 mm).       | Accept after repair. |

(2) Scoring.

- |  |  |
|--|--|
| (a) Not more than 0.010 in. (0,250 mm) in depth. | Accept after repair providing material thickness is not reduced by more than 5 per cent. |
|--|--|

OVERHAUL

(3) Nicks and burrs.

Accept after  
repair.

(4) Distortion.

Accept if compat-  
ibility is  
preserved.

6. Inner and Outer Glands (302-100/110)

A. Inspect Glands.

(1) Compatibility. Assemble gland with bracket (302-90);  
secure temporarily.

(a) Cable holes misaligned.

Reject.

(2) Nicks and burrs.

Accept after  
repair.

7. Engine Vibration Transducer (303-10)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Vibration Transducer.

(1) Wear.

(a) Bolt holes elongated  
not more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

(2) Nicks and burrs.

Accept after  
repair.

(3) Flatness.

(a) Mounting surface flat.

Accept.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

C. Inspect Contact Pins.

(1) Damage.

(a) Any damaged or bent pins. Reject.

(2) Wear.

(a) Slight witness mark. Accept.

D. Inspect Insulator.

(1) Cracks.

(a) Any cracks or chipping around connector pins. Reject.

E. Carry Out Insulation Checks.

NOTE: Using a 50 V insulation tester, measure the insulation resistance between the transducer body and each pin and measure the insulation resistance across the pins.

(1) Resistance.

(a) Not less than 20 megohms. Accept.

F. Carry Out Rig Test (Ref.77-33-02 Testing).

ENGINE VIBRATION TRANSDUCER CABLE - DISASSEMBLY

1. General

- A. Prior to commencing the disassembly, refer to 71-09-00 Disassembly for general information.
- B. Throughout the test special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. This section contains the procedure for the disassembly of the engine vibration transducer cable after removal from the engine.
- D. The procedure for the removal of the transducer cable from the engine is detailed in 71-00-01.

2. Disassembly of the Engine Vibration Cable (Pre.SB.77-8)

- A. To effect removal of the engine vibration cable from the engine, the cable is cut close to the connector at the bracket end.
- B. There is no provision for the installation of a cable or connector to this standard on the engine, discard the cable and remove any serviceable parts from the connector at the transducer end (Ref. para.3.C).

3. Disassembly of the Engine Vibration Cable (SB.77-8 and SB.71-11)

A. General.

- (1) To effect removal of the engine vibration cable from the engine, the cable is cut close to the wall mounting receptacle.
- (2) The connector at the transducer end of the cable is not normally required to be disassembled from the cable providing the length of cable is sufficient to be within acceptable limits after installation on the engine (Ref.71-00-02 Assembly, para.5.).

77-33-01

Page 101  
Feb 1/77

OLYMPUS 593

OVERHAUL

B. Disassembly of the Wall Mounting Receptacle (Ref.Fig.101).

- (1) Remove the lockwire from the wall mounting receptacle.
- (2) Remove the two clamp screws and clamps.
- (3) Remove the telescopic bushes.
- (4) Unscrew and remove the plug end bell from the plug body.
- (5) Withdraw the three contacts from the plug body using the insert/extractor tool (Tool 2701).
- (6) Discard the remaining cut cable with the contacts.

C. Disassembly of the Connector (Transducer End) (Ref.Fig.102).

NOTE: Before disassembly, refer to para.3.A.(2).

- (1) Remove and discard the sealing ring.
- (2) Remove the locking clip.
- (3) Cut and remove the whipping.
- (4) Unscrew the clamp nut and remove.
- (5) Remove the connecting nut and housing.

NOTE: Further disassembly will damage the components, if the cable is outside the limit for re-assembly to the engine, discard the cable and remaining attached components.

## ENGINE VIBRATION TRANSDUCER CABLE - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

## ENGINE VIBRATION TRANSDUCER CABLE - ASSEMBLY

### 1. General

- A. This section contains the procedure for the assembly of a new engine vibration transducer cable prior to assembly to the engine as detailed in 71-00-01.
- B. Throughout the text special tools are quoted by their Ref.No., e.g. (Tool 1234). For a complete list of tooling required for assembly and for the Manufacturer's Part No., refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.
- C. During the assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) 77-33-01 to identify those items where the nomenclature does not positively identify them due to the duplication of the title. When the item is part of the breakdown of the text concerned, the item will be identified as (1-210), the 1 referring to the I.P.C. Fig.No. and the 210 referring to the Item No.
- D. Approved materials used during the assembly will be identified by the nomenclature and a suffix letter, e.g. tape E. Refer to 71-09-00, Table 501 for the specification and manufacturer, where applicable, for the approved materials used.

### 2. Engine Vibration Cable (Pre SB.77-8)

There is no provision for the installation of a cable or connector to this standard on the engine.

### 3. Assembly of Engine Vibration Cable (SB.77-8 and SB.71-11)

#### A. Prepare to Assemble Connector.

- (1) Cut a length of electrical cable 42 in. (1066,8 mm) long to the following specification.
  - (a) Specification 33655 EDT N2 or CD 1401 (Engines to SB.77-8, pre SB.71-11 standard).
  - (b) Specification ETUDE 45671 (Engines to SB.71-11 standard).
- (2) Disassemble a new connector (1-210) or, using serviceable parts removed from the original connector plus new parts (1-220 through 1-260), proceed to assemble the connector to the cable end.

ASSEMBLY

77-33-01

Page 501

Jan 4/93

OLYMPUS 593

MK.610-14-28  
OVERHAUL

B. Assemble Connector to the Cable End (Ref.Fig.501).

NOTE: All references to details are contained in Fig.501.

- (1) Slide the clamp nut (1-225) on to the cable with the castellation towards the end being terminated (detail A).
- (2) Ensure that the bore and chamfer of the outer screen clamp (1-240) are smooth and free from burrs (detail A).
- (3) Feed the outer screen clamp on to the cable with the split end first (detail A).
- (4) Remove the outer glass fibre jacket for a distance of 1.97 in. (50,0 mm) from the cable end (detail A).
- (5) Remove the Kapton (orange/brown) layer for a distance of 1.97 in. (50,0 mm) from cable end (detail A).

CAUTION: DO NOT DAMAGE OR CUT THE METALLIC BRAIDED SCREEN LAYER OR INDIVIDUAL KAPTON LAYERS SURROUNDING TWO CORE WIRES.

- (6) Apply silicone varnish at the position shown (detail A) to prevent the outer braid from fraying. Allow the varnish to dry.
- (7) Concertina the screen braid sufficiently to allow the insertion of the inner screen clamp (1-250) over the cores and under the screen braid, chamfered end first, using assembly tool (Tool 2705) (detail B). Pull the braid tight, then remove the tool.
- (8) Apply tape E to the position shown (detail C) to achieve the same diameter as the screen braid over the screen clamp.
- (9) Apply a temporary wrapping of tape D over the screen braid flush with forward face of the inner screen clamp.

OLYMPUS 593

MK.610-14-28

OVERHAUL

Assembly of Connector to Cable End (SB.77-8 and SB.71-11)  
Figure 501

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (10) Trim the strands of the screen braid flush with the forward face of the inner screen clamp. Remove the temporary wrapping of tape D.

CAUTION: SCREEN BRAID MUST NOT BE ALLOWED TO FRAY.

- (11) Wrap a 1.26 in. (32,0 mm) length of tape D to give two full turns over the screen braid, overlapping tape E and the forward face of the inner screen clamp by 0.12 in. (3,0 mm) (detail D).

CAUTION: MAKE SURE THERE ARE NO LOOSE STRANDS OF BRAID PRESENT.

- (12) Apply sealing compound A over tape E as shown (detail D).
- (13) Using assembly tool (Tool 2705), advance the outer screen clamp (1-240) with a circular motion (detail E) until its forward edge is 0.039 in. (1,0 mm) rearward of the forward edge of the tape D (detail F). Remove the assembly tool.
- (14) Using any solid state transistorised resistance tester on the 50 volt range, ensure that the insulation resistance between the outer screen clamp and the screen braid is above 20 megohms.
- (15) Crimp the inner and outer screen clamps together using the crimping tool (Tool 2709) with 0.213 in. (5,4 mm) A/F dies (detail F). Repeat the insulation test (Ref. para. (14)).
- (16) Remove the second Kapton layer and glass-fibre fillers flush with the forward edge of tape B.
- (17) Cut individual core wires to a length of 0.315 in. (8,0 mm) from the forward edge of the outer screen clamp (detail F).

MK.610-14-28  
OVERHAUL

- (18) Remove the individual Kapton insulation from each of the two core wires for a distance of 0.197 in. (5,0 mm) from the end of the cable (detail F).
- (19) Assemble the contact pins (1-227) to the core wires (detail G) using the crimping tool (Tool 2703) and positioner (Tool 2704), or the crimping tool (Tool 2707) and insert (Tool 2708) (Ref.Fig.502).
  - (a) Insert a core wire into the rear of a contact pin so that the insulation on the core wire abuts the rear of the contact.
  - (b) Ensure that the core wire is visible through the inspection hole of the contact pin.
  - (c) Crimp the contact pin using the crimping tool ensuring that the shoulder of the contact pin abuts the crimping tool before pressure is applied.
  - (d) Crimp a contact pin onto the remaining core wire in the same manner (Ref.(a) to (c)).
- (20) Slide the sealing ring (1-260) over the pins and onto the outer screen clamp until it abuts the step. Space the contact pins approx. 0.130 in. (3,3 mm) apart, then enter them into their inserts in the housing connector and push the screen clamps into the housing (1-270). Ensure that the distance from the ends of the pins and the face of the housing is not more than 0.256 in. (6,5 mm) (detail G). Withdraw the screen clamps and pins from the housing.
- (21) Coat the crimped area of the screen clamps with sealing compound A and also fill the front recess as shown (detail H).
- (22) With the contact pins spaced 0.130 in. (3,3 mm) apart, enter the pins into their inserts in the housing connector and push the screen clamps into the housing (detail J). Remove any surplus sealing compound. Slide the clamp nut (1-225) along the cable and over the outer screen clamp, then screw the (left-hand threaded) nut onto the housing connector and torque-tighten between 40 and 60 lbf in. (4,5 and 6,8 N.m) until the castellations of the clamp nut align with those of the connecting nut. Engage the locking clip (1-220) in the castellations (detail L).

OVERHAUL

(23) Apply sealing compound A to the split in the outer screen clamp (detail K), then West Country whip to the area indicated (Ref.Fig.503) as follows:

- (a) Middle the lacing braid A, then pass the ends around the split in the outer screen and tie a reef knot.
- (b) Half-knot the lacing braid on alternative sides until the end of the split is reached.
- (c) Reef knot the ends of the braid securely, then cut off the ends of the braid leaving free ends 0.315 in. (8,0 mm) in length.

NOTE: All the knots are to be on the cable.

- (d) Cement the finished ends with silicone varnish A.

4. Assembly of Engine Vibration Transducer Cable (SB.77-8611-26 or 77-8661-28)

A. Assemble Transducer Connector to Cable (Ref.Fig.504).

- (1) Remove outer sheath for a distance of between 25,0 and 28,0 mm from one end of a suitable length (107 cm) of replacement cable (1A-350) (Detail A). Avoid damaging screen braid.
- (2) Comb out screen braid, fold back over outer sheath and trim to leave 6,0 mm of exposed braid. (Detail B).
- (3) On engines to SB.77-8661-28 standard cut off drain wire flush with braid fold edge and trim off fillers to fold edge.
- (4) Assemble sleeve (1A-340) to cable and heat shrink over the back fold of screen braid. (Detail C).
  - (a) Set thermo-gun (Tool 2603), with reflector (Tool 2605) attached, to give a minimum temperature of 380°C. Switch on and allow to heat for 5 minutes to reach required temperature.

OVERHAUL

- (b) Position sleeve over the back fold of screen braid with a 3,0 mm projection from braid fold edge over the cores.
  - (c) Direct hot air all round sleeve until sleeve becomes transparent and shrinks to grip the cable and then remove heat source and allow sleeve to cool. Heat application may be from 8 to 20 seconds but should not exceed 50 seconds.
  - (d) Check visually that there are no splits in the sleeve and that there are no signs of heat damage.
- (5) Assemble contacts to cable cores and insert into insulator.
- (a) Remove insulation from end 4 mm of core to be crimped. (Detail C).
  - (b) Assemble contact socket (1A-320) to end of cores, ensure that insulation abuts end of contact socket and conductor is visible through inspection hole, then crimp the contacts with the crimping tool (Tool 2703).
  - (c) Insert core into coloured end of insert tool (Tool 3128).
  - (d) Using firm even pressure, press tool against contact shoulder and insert contact and tool into connector front case (1A-310A) until retaining tines snap into place behind contact shoulder.
  - (e) Withdraw tool from insulator, lightly pull core to ensure contact socket is properly seated.
- (6) Assemble connector front case to connector rear case (1A-330) and firmly hand-tighten.
- (7) Assemble clamp bar (1A/290) to rear case and secure with two screws tightened until the sleeve is firmly gripped and there is no visible gap at the clamp bar mating face.
- (8) Wire-lock the back nut to the fixed clamp bar or to one of the clamp bar screws.

ENGINE VIBRATION TRANSDUCER CABLE - SPECIAL  
TOOLS, FIXTURE AND EQUIPMENT

1. General

- A. The special tools, fixtures and equipment listed in Table 1001 are those required to assemble the engine vibration transducer cable prior to installation on the engine.
- B. The tools have been listed in their order of usage and the Tool Ref.No. is the number quoted in the text. Tools with an \* are used in more than one aspect of overhaul, and will be duplicated in the tables. Tools used other than those supplied by Rolls-Royce (1971) Limited are indicated by the component manufacturer and part number.

TOOL REF.NO.	MANUFACTURERS PART NO.	DESCRIPTION
* 2701	CANNON NAS.1664-16	Insert/Extractor Tool

## ENGINE VIBRATION TRANSDUCER - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

ENGINE VIBRATION TRANSDUCER - TESTING

1. General

- A. This testing must be carried out on completion of the work detailed in Engine Indicating, 77-10-00 Inspection/Check, or at any intermediate point as directed therein.
- B. It is assumed that the items making up components to be tested have been selected for compatibility and that any moving and fixed items have acceptable clearances, that mating surfaces have been correctly matched and any defective items have been repaired or replaced.
- C. Where a component forms part of a system, any later testing will be cross referenced to the Testing topic for the complete system when applicable. Testing to be carried out during assembly or installation is not cross referenced in this topic.
- D. To enable the items within this topic to be identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (IPC); thus, Fig.701-40 (701/40) in this text equates with the relevant Fig. and Item No. in the same topic in the IPC. Table 701 provides a cross reference to the equivalent IPC illustrations.
- E. Dimensional checks (when applicable) are cross referenced to the Fits and Clearances Schedule (FCS) at the relevant stage in the test procedure.
- F. Test equipment is listed in Table 702. Where specific equipment is not quoted, details of the purpose, range and accuracy of suitable equipment are provided, together with a test diagram.

## 2. Test Equipment

A. The test equipment required is listed in Table 702.

DESCRIPTION	PURPOSE
Vibration table (moving coil vibrator) with a Power Amplifier and Variable Audio Oscillator.	Simulate operating conditions and provide vibration levels for transducers.
Master Accelerometer - to be used in conjunction with:	Comparator.
Endevco Accelerometer Calibrator Type 28350F and an A.C. Valve or Transistor Voltmeter.	Calibration.
Precision Voltage Ratio Box of 10 K ohms impedance.	Calibration.
Digital Frequency Meter.	Monitoring oscillator frequency.
Double Beam Oscilloscope.	Monitoring sinusoidal waveform.
Millivoltmeter	Setting vibration levels and comparing master accelerometer and transducer under test.

Test Equipment  
Table 702

## 3. Rig Test Vibration Transducer (701-10)

NOTE: Ensure the Vibration Transducer has been inspected and cleared for rig test (Ref.77-10-00 Inspection/Check).

A. Prepare Test Equipment.

- (1) Ensure that the mounting surface of the vibration table is flat and free from burrs around the threaded holes.

OVERHAUL

- (2) Clean the mounting surface of the vibration table and the transducer mounting face.
- (3) Assemble the transducer to the vibration table using the four attachment bolts provided and ensuring that the bolts are tightened evenly.

NOTE: Uneven tightening can cause a resonance at certain frequencies which will produce a distorted waveform from the master accelerometer and the transducer under test giving incorrect results.

- (4) With reference to Fig.702 for the layout of the equipment, install the equipment and connect up in accordance with the manufacturers instructions.

NOTE: It is essential that the vibration table movement is sinusoidal and free from resonance.

NOTE: The waveform of the output from the master accelerometer and the vibration transducer under test must be displayed on the double beam oscilloscope and monitored throughout the test. Any deviation from a sine wave will adversely affect the test/calibration.

B. Carry Out Rig Test (Ref.Fig.702).

- (1) Using the proprietary test equipment, calibrate the vibration transducer to the following acceptance standards.
- (2) Basic sensitivity.
  - (a) At a frequency of 123 Hz and an acceleration level of 10 g (peak) the basic charge sensitivity must be within  $10 \text{ pC/g} \pm 0.2 \text{ pC/g}$ .
- (3) Linearity of sensitivity.
  - (a) At a frequency of 123 Hz and at acceleration levels of 1, 2, 5, 15 and 20 g (peak) the charge sensitivity must be  $10 \text{ pC/g} \pm 0.3 \text{ pC/g}$ .

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (4) Frequency response.
- (a) At a maintained acceleration level of 3 g (peak) and at frequencies of 20, 40, 70, 100 and 123 Hz the charge sensitivity must be 10 pC/g  $\pm$  0.3 pC/g.
  - (b) At a maintained acceleration level of 20 g (peak) and at frequencies of 123, 200, 400, 700, 1000 and 1500 Hz the charge sensitivity must be 10 pC/g  $\pm$  0.3 pC/g.
- (5) Record all test data on the transducer work sheet.

REHEAT CHAMBER VIBRATION TRANSDUCER  
AND CABLE - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OVERHAUL

#### FLEXIBLE SPACER ASSEMBLY

REP 3-90-1 Reconditioning of the spacer hinge pin by weld build up.

#### VENTILATION SHROUD

REP 3-130-1 Filler welding cracks in the outer metal sheet.  
REP 3-130-2 Reconditioning the ventilation shroud by means of riveted patches or by renewing damaged parts.  
REP 3-130-3 Repairing the heat insulating metal sheet (heat shield) with resistance welded patches.

#### SPHERICAL JOINT BOX

REP 4-50-1 Reshaping of the attaching flange.

#### ANGULAR POSITION STOP

REP 4-60-1 Reshaping.  
REP 4-60-2 Fusion (weld) hard facing of the stop contact faces.

#### ANTI-ROLL BOX

REP 4-110-1 Crack filler welding.

#### CONNECTING LINK

REP 4-120-1 Reshaping.  
REP 4-120-2 Re-application of anti-seize.

FOREWORD1. Effectivity

Some procedures described in this manual such as assembly, repair procedures, etc... specifically relate to given types of equipment. Hence, effectivity reference numbers are used which relate equipment to procedures.

These effectivity reference numbers can take the form of either a manufacturer's reference number or a serial number.

The table drawn up below will enable you to make the association between the two sets of numbers.

Manufacturer's ref No.	Serial No.
301-218-000-0	6001 to 6020
301-218-004-0	6021 to 6028
301-218-005-0	6029 to 6082 etc

## DESCRIPTION - OPERATION

### 1. Description

#### A. Composition

The reheat jet-pipe basically comprises :

- The reheat duct,
- The anti-screech liner.
- The ventilation shroud.

The major component is the reheat duct which is made of austenitic alloy. The anti-screech liner is mounted in the front section and can move within the rear section on slides. The ventilation shroud, which surrounds the reheat duct, carries, on its upper half, a heat shield composed of quartz glass fiber sandwiched between two wafered stainless steel sheets. The ventilation shroud is attached to the front of reheat duct by 10 lugs, and located at the rear by 8 flexible spacers.

The reheat duct is fitted "floating" between the primary nozzle and the engine.

The connecting link connects the spherical joint-flange, secured to the basic engine rear flange - and the reheat jet-pipe. It transmits the axial pull of the jet-pipe and prevents its longitudinal movement. Angular movement of reheat duct is prevented by a stop fixed to the reheat duct. The angular position stop prevents rotation of the reheat duct by bearing on two bosses on the spherical joint flange.

The rear flange of the reheat duct is surrounded by two half-deflectors, which project rearwards any gas which may leak around the reheat duct/primary nozzle joint face. The lower half deflector is fitted with a fuel drain pipe connection, which serves to drain any fuel which may accumulate, for example, after a false start.

OVERHAUL

## 2. Operation

The reheat duct, at whose inlet the reheat fuel is burnt, channels the gas flow from the engine to the primary nozzle.

The "floating" assembly of the duct allows :

- the absorption of the expansion of the basic engine and the reheat jet pipe as well as wing deflections.
- correct alignment of the jet pipes despite the differences in geometry dependent upon whether they are fitted in a left or right hand nacelle.
- easy installation and removal of the reheat jet pipe.

To avoid random movement, the rear section of the reheat duct is slightly conical, which imposes a rearward force on the duct during operation.

The anti-screach liner reduces the level of the vibration phenomena during operation. This is achieved by the nature of its corrugations and dilution holes.

The ventilation shroud protects the nacelle and the wing from heat radiation.

## DISASSEMBLY

### 1. General

- A. During dismantling, follow the recommendations given in chapter 70-05-00 of the manual of Standard Practices and in the working procedures section of the Overhaul manual.
- B. Use only tools and other special equipment nominated in the dismantling procedures, and identified by a number SC... The tools are shown in the Illustrated Tools and Equipment Manual (I.T.E.M).
- C. During dismantling, visually inspect all parts removed and report, to the inspection department, any defects found which could be obliterated by cleaning (scratches, burning etc.) and which may result from incorrect operation. Also report any broken parts or any missing locking devices.
- D. In the working procedures section of the manual, parts are referenced to the I.P.C by two numbers in brackets, the first of which is the figure number in the I.P.C, the second being the item number within that figure.

### 2. Disassembling reheat jet pipe

NOTE : The reheat jet pipe is assumed to be upright on its rear flange on the transport trolley - tool SC 97 -

#### A. Placing on the work bench - tool SC9 -

- (1) Fit the two "clamps" - tool SC7 - to the reheat jet pipe.
- (2) With a hoist, bring up lifting beam - tool SC8 - and lock its attachment points to the reheat jet pipe.
- (3) Lift the reheat jet pipe onto the work bench - tool SC9 - It is to be stood on the anti-screach liner end flange of the reheat duct.

#### B. Removal of half-deflectors

- (1) Remove the 10 off 12 pointed head bolts (2-20).
- (2) Collect the 10 washers (2-30).
- (3) Gently lower the ventilation shroud and rest it on the brackets on the table - tool SC9 -

78-11-01

Page 101  
Dec 30/74

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (4) Unscrew the nut connecting the fuel collector tube (4-130) to the lower half-deflector (1-100) - tool SC 20 -
- (5) Removing the upper lifting ring (1-50).
  - (a) Remove the self-locking nuts (1-20).
  - (b) Remove the hexagon head bolts (1-30) and washers (1-40).
- (6) Removing the upper half-deflector (1-10).
  - (a) Remove the self-locking nuts (1-60).
  - (b) Remove the hexagon head bolts (1-70), washers (1-80) and bushes (1-90).
- (7) Removing the two lower lifting rings (1-140).
  - (a) Remove the self-locking nuts (1-110).
  - (b) Remove the hexagon head bolts (1-120) and washers (1-130).
- (8) Removing the lower half-deflector.
  - (a) Remove the self-locking nuts (1-150).
  - (b) Remove the hexagon head bolts (1-160), washers (1-170) and bushes (1-180).

C. Removal of the ventilation shroud (2-10)

- (1) Fit the clamps - tool SC 11 to the ventilation shroud.
- (2) Compress the flexible spacers (3-90) using 8 clamps - tool SC 13 -
- (3) Position 10 spades - tool SC 14 - to displace the mounting lugs (5-160).
- (4) Using a hoist and 3 branch sling, remove the ventilation shroud (2-10).

D. Disassembling reheat duct

- (1) Removal of fuel collector tube (4-130).
  - (a) Remove the 12 point head bolts (4-140) and the collar (4-150).
  - (b) Remove the hexagon headed bolts (4-160).

78-11-01

Page 102  
Dec 30/74

OLYMPUS 593

MK.610-14-28  
OVERHAUL

NOTE : The locking plates (4-170) will be removed at the same time as the anti-screech liner (5-10).

- (2) Removal of the connecting link (4-120).
  - (a) Remove the link protector - tool SC 19 -
  - (b) Disengage the link by rotating it through 90°.
  - (c) Dismantling the link.
    - 1) Remove the slave nut (4-70) and collect bolts (4-80) and lock washers (4-90).
    - 2) Remove the anti-roll housing (4-110).
    - 3) Disengage the spherical joint housing (4-100) by rotating it by 90°.
  - (d) Remove the hexagon head bolts (4-10) and (4-30), lock washers (4-20) and (4-40).
  - (e) Remove the angular position stop (4-60).
  - (f) Extract spherical joint housing (4-50) using extractors - tool SC 10 -
- (3) Removal of the support (4-200)
  - (a) Remove the hexagonal head bolts (4-180) and lock-washers (4-190).
- (4) Removal of lifting ring (4-240)
  - (a) Remove the self-locking nuts (4-210).
  - (b) Collect the hexagonal head bolts (4-220) and washers (4-230).
- (5) Removal of lifting rings (5-50)
  - (a) Remove blind nuts (5-20)
  - (b) Withdraw bolts (5-30) and locking plates (5-40).
- (6) Removal of the anti-screech liner (5-10)
  - (a) Remove blind nuts (5-60) and hexagonal nuts (5-90).
  - (b) Withdraw bolts (5-70), (5-100) and locking plates (5-80), (5-110).

78-11-01

Page 103  
Dec 30/74

- (c) Remove hexagon head bolts (5-120).
  - (d) Remove locking plates (5-130) and (4-170).
  - (e) Remove the reheat duct (5-240).
  - (f) Collect up spacers (5-140).
  - (g) Remove slides (5-150) from the anti-screech liner by rotating them through 90°.
- (7) Dismantling of the reheat duct
- (a) Remove self locking nuts (5-170).
  - (b) Collect up the hexagon head bolts (5-180) and washers (5-190).
  - (c) Remove lugs (5-160).
  - (d) Remove self locking nuts (5-200).
  - (e) Collect the hexagon head bolts (5-210) and washers (5-220).
  - (f) Remove the clamp support (5-230).
- (8) Dismantling the ventilation shroud
- (a) Remove the flexible spacers (3-90).
    - 1) Remove the self-locking nuts (3-100).
    - 2) Collect the 12 point head bolts (3-110) and the internal plates (3-120).
  - (b) Removal of blanks.
    - 1) Remove self-locking nuts (3-10).
    - 2) Collect up washers (3-20), hexagon head bolts (3-30) and washers (3-40).
    - 3) Remove the hexagon head bolts (3-50).
    - 4) Collect up washers (3-60) and covers (3-70).

OLYMPUS 593

OVERHAUL

CLEANING

## 1. General

- A. At completion of disassembly, clean thoroughly all the parts of the reheat jet pipe so as to remove all surface contamination such as oils, greases, carbon deposits, corrosion and oxidation marks.
- B. The purpose of cleaning is to :
  - (1) Contribute to exhaustive visual inspection of parts.
  - (2) Disclose cracks due to operation through use of fluorescent penetrant inspection methods.
  - (3) Prepare surfaces in view of future repair work.

## 2. Specific recommendations

- A. Any cleaning method selected by an operator shall comply with the following requirements to avoid penalization on the parts service life.
  - (1) Do not degrease titanium parts, either welded or not, using halogen products such as chlorinated solvents, trichlorethylene etc...
  - (2) Do not strip in acid solutions parts having complex shapes or featuring blind holes, i.e. parts on which rinsing or neutralization are particularly difficult to carry out properly.
  - (3) Do not use cleaning agents the action of which may induce generalized or intergranular corrosion of materials, specially on those materials showing aging due to operation on engine.
- B. Limitations related to electro-platings, chemical surface treatments, paints, varnishes and hardface metal coatings.
  - (1) The cleaning methods recommended in this chapter are normally not harmful to the protective surface treatments applied on the reheat jet pipe constitutive parts.

78-11-01

Page 201  
Dec 30/74

**OLYMPUS 593**

MK.610-14-28

OVERHAUL

- (2) To avoid deterioration to surface treatments of parts or allow their future refurbishing, a list of the coated parts and their location (identification in regards of the Illustrated Parts List) is given hereunder.

(a) Silver coated parts nomenclature

Description	IPL Fig.item	Coated part base metal
Self-locking nut	1-20, 60, 110, 150	Austenitic alloy
Lower half deflector	1 - 100	Austenitic steel (nut on part)
Self-locking nut	3 - 10, 100	Austenitic alloy
Hexagonal head bolt	4 - 10, 30, 80, 160, 180	Austenitic alloy
Hexagonal nut	4 - 70	Austenitic alloy
12 point head bolt	4 - 140	Austenitic steel
Self-locking nut	4 - 210	Austenitic alloy

# ATP TEMPORARY REVISION

## BRITISH AIRWAYS

OLYMPUS 593 OVERHAUL MANUAL  
EXHAUST SYSTEM REHEAT JET PIPE

This Temporary Revision complies with BCAR's Chapter A6-2 and TSS No. 0-2.

for Chief Engineer (Technical & Quality Services) CAA Design Approval No.  
DA1/8566/78

### TEMPORARY REVISION 78-523

Insert in 78-11-01 facing page 301

#### REASON FOR ISSUE

To introduce a refurbishment specification to the reheat Jet Pipe Overhaul (MCR.EPO.451/MD).

#### ACTION

#### Concorde Exhaust System Refurbishment

##### Introduction

The exhaust system consists of four main components:-

- (a) The Reheat Jet Pipe
- (b) The Primary Nozzle
- (c) The Twin Secondary Nozzle
- (d) The Thrust Reverser Bucket

Their Refurbishment Specifications are as follows:-

Reheat Jet Pipe	CON 78.11.01.100 Issue 1
Primary Nozzle	CON 78.12.01.100 Issue 1
Twin Secondary Nozzle	CON 78.13.01.100 Issue 1
Thrust Reverser Bucket	CON 78.31.01.100 Issue 1

These refurbishment schedules fulfil the life development requirements of the Approved Maintenance Schedule (A.M.S.).

The work listed in the Refurbishment Schedule is to allow the unit to be considered as a "Condition Monitored" (C.M.) unit.

This means that such units are currently considered to have no known hidden "wear out" features that require planned time interval specific inspections. However, such units may be required to be stripped and inspected purely to gain experience of their condition, i.e. life samples when it is considered that opportunity arisings of strip and inspection are inadequate. Such life sampling requirements will be indicated by an A.M.S. revision.

#### Notes

Where the term "visual inspection" is used, it implies a visual inspection of all parts exposed arising either as a result of the minimum work content of the Refurbishment Schedule or to a greater depth of strip dictated by other reasons, i.e. repair of damage embodiment of modifications, etc.

When in the course of visual inspection evidence exists, e.g. wear witness, distortion, etc. that requires further stripping, it must be referred to Propulsion Engineering for a review of acceptance standards and agreement to further strip

# BRITISH AIRWAYS

## OLYMPUS 593 OVERHAUL MANUAL EXHAUST SYSTEM REHEAT JET PIPE

TEMPORARY REVISION No. 78-523 (Cont'd.)

### Concorde Exhaust System Refurbishment Schedule Reheat Jet Pipe

#### Specification No. CON 78.11.01-100 Issue 1

1. The Jet pipe is to be disassembled IAW OHM ref. 78-11-01 P/B 100.
2. At the completion of disassembly, clean thoroughly all the parts of the Reheat Jet Pipe so as to remove all surface contamination such as oils, greases, carbon deposits, corrosion and oxidisation marks IAW OHM 78-11-01 P/B 200.
3. Crack detect parts listed in OHM 78-11-01 page 304, using Fluorescent penetrant method. All parts failing to meet the required standard must be held for possible repair development.
4. Visually inspect all parts IAW OHM 78-11-01 P/B 300 and repair as required. Any parts that is damaged beyond the repair limits must be held for possible repair development. Any part that is damaged and has no cleared repair scheme must be held for possible repair development.
5. Embody Modifications IAW the BA Modification call up list.
6. Inform Propulsion Engineering of any defects found during refurbish.
7. Re-assemble the Jet Pipe IAW OHM 78-11-01 P/B 500.
8. The Jet Pipe inspection and release documentation is to state the specification number to which the unit has been refurbished.

OLYMPUS 593  
MK. 610-14-28  
OVERHAUL

## INSPECTION

### 1. Introduction

#### A. Inspection - General

(1) The "Estimate" inspection carried out on items removed from the accessory during overhaul aims at:

- eliminating worn-out or damaged items too expensive or impossible to be repaired.  
However these items may be kept as the parts remaining sound may be used to repair an identical item,
- indicating the modifications to be applied to bring to a new standard,
- indicating the repairs to be carried out.  
If the case has not been foreseen - Apply to the SNECMA repair office,
- eliminating parts having reached life limit.

#### B. Prepare for "Estimate" inspection

(1) Following disassembly clean each item according to the appropriate method defined in the "cleaning" section of the overhaul manual.

NOTE: Make sure that any assembly "awaiting inspection" be stored in "boxes" or containers provided for this purpose.

This inspection must be carried out on thoroughly clean parts.

Place all the parts making up the sub-assembly on the inspection tables covered with anti-shock material (Lino or similar material).

(2) Make a list of the modifications to be applied for each sub-assembly.

(3) Inspect the parts.

#### C. "Estimate" Inspection

CAUTION: DURING INSPECTION OPERATIONS THE PARTS MUST BE HANDLED WITH THE GREATEST CARE TO AVOID BLOWS, SCRATCHES, ETC...

**78-11-01**

Page 301  
Dec 30/74

- (1) Personnel carrying out this inspection must have a thorough knowledge of the instructions given in Inspection and Repair sections of this manual and in the corresponding chapter 70.  
It must be conscious of the importance of its decisions and of their consequences. A good technical and functional knowledge of the accessory will enable this personnel to carry out an efficient and intelligent inspection, particularly in vital zones.
- (2) The inspection methods to be used are the following:

- Visual inspection.
- Inspection for soundness.
- Dimensional inspection.

NOTE: These inspections are best carried out in the order given so that faulty, not repairable parts detected during visual or soundness inspection may be discarded before the geometrical inspection is undertaken.

Should new defects be detected the repairer will request the study of a repair scheme from SNECMA.

- (3) During inspection each part will be labelled (see chapter 70-10-00) so as to indicate:
  - if it is fit for putting back in service,
  - if it requires repair,
  - if it must be replaced.

The labelling of parts can be used to record dimensions that may affect a play or a tolerance. This record will enable inspection to check the play or tolerance on final assembly.

#### D. Protection against corrosion following inspection

- (1) After inspection, when 3 months elapses before re-assembly, apply a temporary protection to carbon steel, alloy steel and martensitic alloy parts using a dehydrating oil such as Ensis Fluid 254 (P309) or ARDROX 396/1E8 (P373) or RUSTILO DW377 (P373).

## 2. Visual inspection

- A. Visual inspection is an operation which starts on reception of the accessory (inventory) and continues during disassembly, on table inspections, re-assembly, testing and dispatching.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (1) Visual inspection generally concerns the following points :
- each part is examined to ascertain its general condition and make sure it is fit for service. Refer to chapter 70-21-00.
  - parts featuring sheet metal elements must be devoid of nicks, metal rips, heavy distortion and/or, burning marks.
  - threads and tapped holes must not be damaged.
  - hinged parts (such as, pin/bush bores, link rod spherical joint inner/outer liners...) must be free from seizing or scratching indications ; if not, remove defects using fine emery cloth.
  - parts featuring areas with hard-face protection must not show flaking.
  - rivets securing various elements on riveted assemblies, must not be loosened, rotating, or missing, otherwise change rivets.
  - self-locking nuts, must have a satisfactory locking torque. Refer to chapter 70-21-00 ; otherwise, renew nuts.
  - crimped self-locking nuts must have satisfactory locking torque. Refer to chapter 70-21-00 ; otherwise, renew nuts.
- (2) Steps to be taken, with regard to damages found on parts, are given in paragraph 5, "Inspection of parts".

### 3. Inspection for soundness

- A. The main purpose of the inspection for soundness is to ascertain that the accessory parts are not cracked. The inspection methods used are the following :
- Visual inspection
  - Dye penetrant inspection - refer to chapter 70-20-10
- M 502 B : Water washable fluorescent penetrant inspection (except for titanium parts)
- P : penetrant spraying
  - T : immersion in penetrant

78-11-01

#### 4. Dimensional inspection

##### A. General

##### (1) Measuring instruments

The selection of any measuring instrument is to be made in relation to the precision desired.

##### (a) Instrument classification

Two kinds of measuring instruments are to be distinguished :

- standard and universal measuring instruments such as : slide gages, micrometers, depth gages, dial indicators of various types, miscellaneous gages, etc...

This equipment is part of the provisioning items that are procurable in the trade and require no particular comment provided that they are available in the required quantity and precision, and satisfy to the requirements for the work to be undertaken.

- special inspection equipment such as : bases, supports, rigs, jigs, etc...

## 78-11-01

OLYMPUS 593

MK.610-14-28

OVERHAUL

These tools are identified by a type number in the manual text at the exact place where they are used.

(b) Calibration

Measuring instruments used in overhaul are to be checked periodically according to a procedure defined in relation to master instruments (SNECMA to be informed of procedure), themselves checked in relation to the official master instruments of the country concerned.

The Official Control Authorities of the countries where repairs are carried out will have to take steps to ensure that the repairer has set up suitable facilities and equipment.

In the absence of a procedure in the countries concerned the repairer will request from SNECMA the procedure applied in their own workshop.

B. Dimensional Inspection of Parts

Details concerning the dimensional inspection and the acceptance criteria are given in paragraph 5 "Parts Inspection".

5. Inspection of Parts

A. Upper Half-Deflector (1-10)

(1) Visual inspection

- (a) A local distortion of the half-deflector sheet metal is acceptable provided it is devoid of cracks ; if not, patch repair the half deflector per REP 1-10-2 and BOR 17.
- (b) Rents in the half-deflector sheeting are unacceptable. Repair as instructed under REP 1-10-2 or BOR 17.
- (c) Wear of the grommets to a depth of less than 0,3 mm (0.012 in.) is admissible. In excess of that value, the grommets are to be replaced as directed under REP 1-10-3 and BOR 19.
- (d) Marks of wear on the upstream and downstream stiffeners and the side reinforcement plates are acceptable unless compounded by cracks or punctures. If so, replace the impaired elements as directed under REP 1-10-3 and BOR 19.

PRINTED IN FRANCE

OLYMPUS 593

MK.610-14-28  
OVERHAUL

(2) Soundness inspection

- (a) Cracks in the half-deflector sheeting are repaired by :
  - 1 Weld filling, as directed under REP 1-10-1, if isolated and within an unoxidized area.
  - 2 Patching, as directed under REP 1-10-2, if ramified or lying in an oxidized area.
- (b) Cracks affecting the various riveted parts (grommets, reinforcement plates, etc..) require, under REP 1-10-3, the cracked item to be replaced.

B. Lower Half-Deflector (1-100)

(1) Visual inspection

- (a) Any damage to the thread of the union nut and/or to the nipple is cause, under REP 1-100-4, for the replacement of the draining tube.
- (b) A localized distortion of the half-deflector sheeting is acceptable provided it is free from cracks ; if it isn't, patch-repair the half-deflector as directed under REP 1-100-2 and BOR 18.
- (c) Rents in the half-deflector sheeting are unacceptable. Repair as directed in :
  - 1 REP 1-100-2 In all segments except for the draining-tube region.
  - 2 REP 1-100-4 In the draining-tube area.
- (d) Wear of the grommets a depth of less than 0.3 mm (0.012 in.) is acceptable. In excess of that value, the grommets are to be replaced as instructed under REP 1-100-3 and BOR 20.
- (e) Marks of wear on the upstream and downstream stiffeners, and the side reinforcement plates are admissible unless compounded by cracks or punctures. If so, replace the damaged elements as described under REP 1-100-3 and BOR 20.

78-11-01

Page 307

OLYMPUS 593

MK.610-14-28  
OVERHAUL

(2) Soudness inspection

- (a) Cracks in weld beads are to be repaired by weld filling, as directed under REP 1-100-3 and BOR 16.
- (b) Cracks affecting the half-deflector sheeting are repaired by :
  - 1 Weld-filling, as described under REP 1-100-1, if isolated, and lying outside an oxidized area and the draining-tube region.
  - 2 Patching, as described under REP 1-100-2, if ramified or lying in an oxidized area. BOR 18 may also be used.
  - 3 Replacement of the draining-tube, as directed under REP 1-100-4, if adjoining its region.
- (c) Cracks affecting the various riveted parts (grommets, reinforcement plates, etc.) call, under REP 1-100-3, for the cracked item to be replaced. BOR 16 may also be used.

C. Flexible Spacer Assembly (3-90)

(1) Visual inspection

- (a) Signs of wear on the flexible spacers are acceptable unless their extent threatens perforation. If so, scrap the spacer.
- (b) Check that the weld bead joining the hinge to the block is not broken. If it is, restore the weld bead as directed under REP 3-90-1.
- (c) Repair worn internal end pads by applying BOR 37.

D. Ventilation Shroud Assy (3-130)

(1) Visual inspection

- (a) A localized distortion in the outer web sheet of the shroud is acceptable so long as the affected area shows no cracks or burns. If it does, repair by patching, as directed under REP 3-130-2.
- (b) Rents in the outer shroud sheeting are acceptable and must be patch-repaired as directed under REP 3-130-2.

PRINTED IN FRANCE

78-11-01

Page 308

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (c) In the wafered sheet metal of shroud thermal insulation, deteriorations caused by over temperature or tears resulting from mis-handling are unacceptable.

Depending on how large is the damaged area, the wafered sheet metal must be either locally patch repaired in accordance with REP 3-130-3 or the damaged segment must be renewed, in accordance with REP 3-130-2.

(2) Inspection for soundness

- (a) If cracks spread on top of the outer sheet metal circular webs, repair cracks by filler welding, in accordance with REP 3-130-1.
- (b) If cracks spreading in bottom of the circular webs featuring lines of rivets are found or if a crack concentration or cracks progressing in a star-shaped pattern are disclosed, repair by installation of riveted patches, in accordance with REP 3-130-2.
- (c) If cracks are found in wafered sheet metal of the thermal insulation liner, repair by patch welding in accordance with REP 3-130-3.

E. Spherical Joint Box (4-50, 100)

(1) Visual inspection

Deterioration affecting threads of both tapped (extraction) holes located in the pad flange entails scrapping of the spherical joint box.

(2) Dimensional check

- (a) Wear condition of the spherical bore housing is acceptable if its inner dia. is smaller than or equal to 32,05 mm (1.26181 in.). Beyond this value, scrap the part.
- (b) Out-of-flatness condition of the spherical joint box attaching flange is acceptable if less than 0,5 mm (0.020 in.). Beyond this limit, perform re-shaping of the flange, in accordance with REP 4-50-1.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

F. Angular Position Stop (4-60)

(1) Dimensional check (see fig. 301)

- (a) Distortion due to bending of the angular position flange arm is acceptable if distance measured between planes P1 and P2 is within 5,5 and 7,5 mm (0.216 and 0.295 in. respectively).

Above this value, perform re-shaping of arm, in accordance with REP 4-60-1.

- (b) Peening wear of the stop contact faces is acceptable so long as width of the stop is higher or equal to 47,5 mm (1.870 in.). Under this value, repair the stop contact faces by filler welding, in accordance with REP4-60-2.

G. Anti-Roll Box (4-110)

(1) Inspection for soundness

If cracks are found in the box parent metal or in weld beads of bosses, repair by filler welding, in accordance with REP 4-110-1.

H. Connecting Link (4-120)

CAUTION : THE ANTI SEIZE TREATMENT MUST BE RE-APPLIED SYSTEMATICALLY AT EACH OVERHAUL, IN ACCORDANCE WITH REP 4-120-2.

(1) Dimensional check

- (a) Buckling of the connector link body is acceptable if the measured sag (deflection) is less than 0,3 mm (0.012 in.). Above this limit, re-shape the body, in accordance with REP 4-120-1.

CAUTION : IF THE CONNECTING LINK HAS ALREADY BEEN SUBJECTED TO A PREVIOUS RE-SHAPING (AS INDICATED BY INDEX SCRIBED AFTER THE PART NUMBER) IT MUST BE SCRAPPED.

- (b) Wear condition of the spherical diameter of joints :

1 Is acceptable if diameter is higher or equal to 31,95 mm (1.25787 in.).

78-11-01

Page 311  
Mar 31/78

OLYMPUS 593

MK.610-14-28

OVERHAUL

- 2 Entails reconditioning the spherical joint by metallization if dia. is within 31,70 and 31,95 mm (1.24802 and 1.25787 in.respectively).
- 3 Entails scrapping of the part if dia. is less than 31,70 mm (1.24802 in.).

#### I. Fuel Collector Tube (4-130)

##### (1) Visual inspection

- (a) Thread deterioration of threaded unions at tube ends, entails renewal of damaged union(s) in accordance with REP 4-130-2.
- (b) Conical contact surface of unions must be free from scratches ; if not the case, renew damaged union(s), in accordance with REP 4-130-2.
- (c) Tube surface must be devoid of chafing or scratching marks :  
Otherwise :
  - 1 If depth of defects is less than 0,15 mm (0.00590 in.) remove defects using fine grit emery cloth or paste.
  - 2 If defects are deeper than 0,15 mm (0.00590 in.) machine out and renew the deteriorated segment of the tube, in accordance with REP 4-130-2 or BOR 21.
- (d) Distortions in the support are admissible if unattended with cracks. If cracked, the support is to be replaced in accordance with REP 4-130-2.
- (e) Signs of wear on the square anti-rotation fitting are acceptable after smoothing out the surface.
- (f) A dislocation of the bushes limiting the movement of the sliding guide is unacceptable. Repair by fitting new bushes in accordance with REP 4-130-2.

##### (2) Inspection for Soundness

- (a) If cracks are disclosed in welds joining together the various elements of the tube, repair by filler welding cracks, in accordance with REP 4-130-1.

# ATP TEMPORARY REVISION

## British airways

CONCORDE

OLYMPUS OVERHAUL MANUAL

This Temporary Revision complies with BCAR's Chapter A6-2 and TSS No. 0-2

*P. Munn* for Chief Engineer (Technical & Quality Services) CAA Design Approval No. DA1/8566/78

TEMPORARY REVISION 78-503

Insert in 78-11-01 facing page 313

### REASON FOR ISSUE

To increase wear limits for units not subject to overhaul - DDA A516-27  
(TIS Ref Conc 704).

### ACTION

Reference: "K. Anti-Screech Liner"

Read paragraph (1) (a) as follows:

(a) Spacers showing contact surface wear are acceptable as follows:

1. After overhaul - wear not greater than 0.012 in.
2. After repair - up to ten spacers with wear not exceeding 0.040 in. are acceptable provided that not more than two are adjacent and provided that the wear on the remaining spacers does not exceed 0.018 in.

Beyond these limits, perform spacer renewal in accordance with REP 5-10-2.

TR.78-503

78-11-01

TR Page 1 of 1

OLYMPUS 593

MK.610-14-28  
OVERHAUL

SEE TR

- (b) Cracks affecting the various tube parts (sliding guide, support, etc..) are cause for replacing the cracked item, in accordance with REP 4-130-2.

J. Support (4-200)

(1) Visual inspection

Thread deterioration of the support tapped holes entails scrapping the part.

(2) Dimensional check

Out-of-flatness condition of the support attaching flange is acceptable if less than 0,5 mm (0.020 in.). Beyond this limit, perform re-shaping of the flange in accordance with REP 4-200-1.

K. Anti-Screech Liner (5-10)

(1) Visual inspection

- (a) Spacers showing contact surfaces which, through battering, are worn on a depth from 0,2 to 0,3 mm (0.008 to 0.012 in.) are acceptable. Beyond these limits, perform spacer renewal, in accordance with REP 5-10-2.
- (b) Burn marks, hot-spot indications or missing portion of liner material are unacceptable. Depending on how large is the damaged area, it must be either machined out and patch repaired in accordance with REP 5-10-3 or one or several liner corrugations be renewed, in accordance with REP 5-10-4.
- (c) Impact marks, if unattended with cracks, are acceptable after smoothing out the surface. If cracked, see soundness inspection below.

(2) Inspection for soundness

- (a) Cracked spacers are to be renewed, in accordance with REP 5-10-2.
- (b) Cracks affecting the anti-screach liner sheet metal are to be removed as follows :

78-11-01

Page 313  
Mar 31/78

OLYMPUS 593

MK.610-14-28

OVERHAUL

- 1 Remove cracks originating and spreading on less than 2,5 mm (0.098 in.) from the air passages by elongation of these holes, provided that surrounding sheet metal material is sound, in accordance REP 5-10-1.
- 2 Using an abrasive wheel, remove cracks starting from liner front or rear edges and spreading on a length less than 2,5 mm (0.098 in.) provided that surrounding sheet metal material is sound, in accordance REP 5-10-1.
- 3 By cutting put the damaged area and installing a patch in accordance with REP 5-10-3 replace one or several liner corrugations (this, depending on how heavy is the damage) in accordance with REP 5-10-4, remove the following cracks :
  - a Cracks originating from air passages, longer than 2,5 mm (0.098 in.) or located in a burnt area.
  - b Cracks starting from the liner front or rear edges, longer than 2,5 mm or located in a burnt area.
  - c Cracks originating or located all around the liner front fastening holes.
  - d Cracks originating or located all around the liner rear fastening holes.
  - e Cracks or shrinkage cracks adjacent to existing weld beads.

L. Slide (5-150)

(1) Visual inspection

- (a) Scrap part if tapped holes are damaged.
- (b) On the slide contact surfaces, wear marks 0,2 to 0,3 mm (0.008 to 0.012 in.) resulting from battering, are acceptable. Beyond those limits repair in accordance with BOR 46.

LA. Lug (5-160)

Repair fretting on lug flexible spacer in accordance with BOR 42.

M. Clamp support (5-230)

(1) Visual inspection

Thread deterioration of tapped holes in support, entails reworking the part by insertion of a bush.

N. Reheat Duct (5-240)

(1) Visual inspection

- (a) On central liner of reheat duct, locally bulged distortions are unacceptable, and must be removed by re-shaping if not located in a burnt or cracked area, in accordance with REP 5-240-1. Otherwise, patch repair the central liner of duct in accordance with REP 5-240-3).
- (b) Thread deterioration of tapped holes located in duct pads entails rework of the duct by installation of bushes.
- (c) Signs of wear or seizure on the front and rear spherical joints are acceptable after smoothing out the surface on condition that the dimensional requirements specified below are complied with.
- (d) Impact marks are admissible after smoothing out the surface if they are localized dents without cracks or sharp-edged bottoms. If not, repair the central liner by patching, as described in accordance with REP 5-240-3.
- (e) Surface defects caused by contact with the flexible spacer blocks on the ventilation shroud are acceptable after smoothing out the surface provided they are not deeper than 0,2 mm (0.008 in.). In excess of this value, repair the central liner by metallization.

(2) Inspection for soundness

- (a) If cracks are present in joint weld beads of flanges, pads, liners, weld fill cracks in accordance with REP 5-240-2.
- (b) If cracks originate from any weld bead and progress through the duct sheet metal, remove them by filler welding in accordance with REP 5-240-2 or if cracks feature ramifications, and/or, affect a burnt area, remove cracks by installing patch(es), in accordance with REP 5-240-3.

THIS TEMPORARY REVISION IS ISSUED BY BRITISH AIRWAYS TECHNICAL SERVICES AND COMPLIES WITH BCAR'S CHAPTER A5-3, B5-3 AND/OR TSS No. 0-2 AS REQUIRED. CAA DESIGN APPROVAL No. DAI/8566/78.

FOR CHIEF ENGINEER TECHNICAL SERVICES

TEMPORARY REVISION NO. 78-529

Manual Reference 78-11-01 Page 316

**REASON FOR REVISION**

British Airways information (BA Page 316) re-issued to align with manufacturers Revision No.22.

**ACTION**

1. Reference Para 5.N. (3) Dimensional check

A. Add to Sub Para (a) 2 the following:

Plasma spray in accordance with BOR 36.

B. Add Sub Para (a) 3 as follows:

3 BOR 30 may be used on fretted front and rear flanges by direct welding.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (c) If cracks radiate from a hole, weld fill remove cracks, in accordance with REP 5-240-2.
- (d) If cracks are present in one spherical joint box mounting pad, perform pad renewal.

(3) Dimensional check

CAUTION : A 10°C VARIATION IN TEMPERATURE, RESULTS IN AN APPROXIMATIVE LINEAR CHANGE OF 0,13 mm (0.00512 in.) OF THE FLANGE DIAMETER.

- (a) A reduction of the average outer diameter of the duct front flange spherical bearing surface, measured in Plane P1, materializing the spherical bearing surface largest diameter, in a room at 20°C ambient temperature, is :

- 1 Acceptable if average diameter is higher or equal to 1035,8 mm (40.779 in.).
- 2 Unacceptable if average diameter is less than 1035,8 mm (40.779 in.) and requires flange re-conditioning through metallization in accordance with REP 5-240-4.

- (b) Check procedure (refer to figure 302)

The average diameter of the duct front flange spherical bearing surface is obtained by computing the mean arithmetical value of the eighteen (18) measurements taken in Plane P1.

To take these measurements, proceed as follows :

- 1 On the flange outer front rim, scribe 18 generatrix equally spaced on the half circumference.

CAUTION : UNDER ANY CIRCUMSTANCE, SHOULD THE MARKS SCRIBED BE DETRIMENTAL TO THE SURFACE CONDITION OF THE SPHERICAL BEARING SURFACE.

- 2 Using the stiffening tool SC 118, correct the duct front flange out-of-round.
- 3 Calibrate the measuring gauge TESA UNIMASTER (TESA - S.A. 1020 RENENS - VD/Switzerland-Agent for France: SYNERGIE, 29, avenue Philippe Auguste - 75540 PARIS CEDEX 11 - tel: 44-93-10-00.

## REPAIR

### 1. Format of the repair schemes

Each repair scheme (REP) describes only one operation to be carried out on a single part.

#### A. Repair scheme identification and classification

Any one part is identified by :

- its nomenclature
- its classification in the Illustrated Parts List (Figure-Item)

A repair scheme is identified by :

- the part to which it relates
- the purpose of this repair

These various criteria have been used for identification and classification purposes.

##### (1) Identification

The identification of a repair scheme is given by :

- the nomenclature of the part with its IPL reference No. (Figure-Item)
- the purpose of the repair preceded by its numerical order

##### (2) Classification

The classification of a repair scheme is given by :

- the A.T.A. breakdown system
- the number of the repair scheme which is given by :
  - (a) The part IPL classification (Figure-Item) and the repair numerical order.
- the page number, proper to any repair scheme (re-starts from page 401 for each repair scheme)
- the date

##### (3) Sample of identification and classification

**78-11-01**

FOREWORD

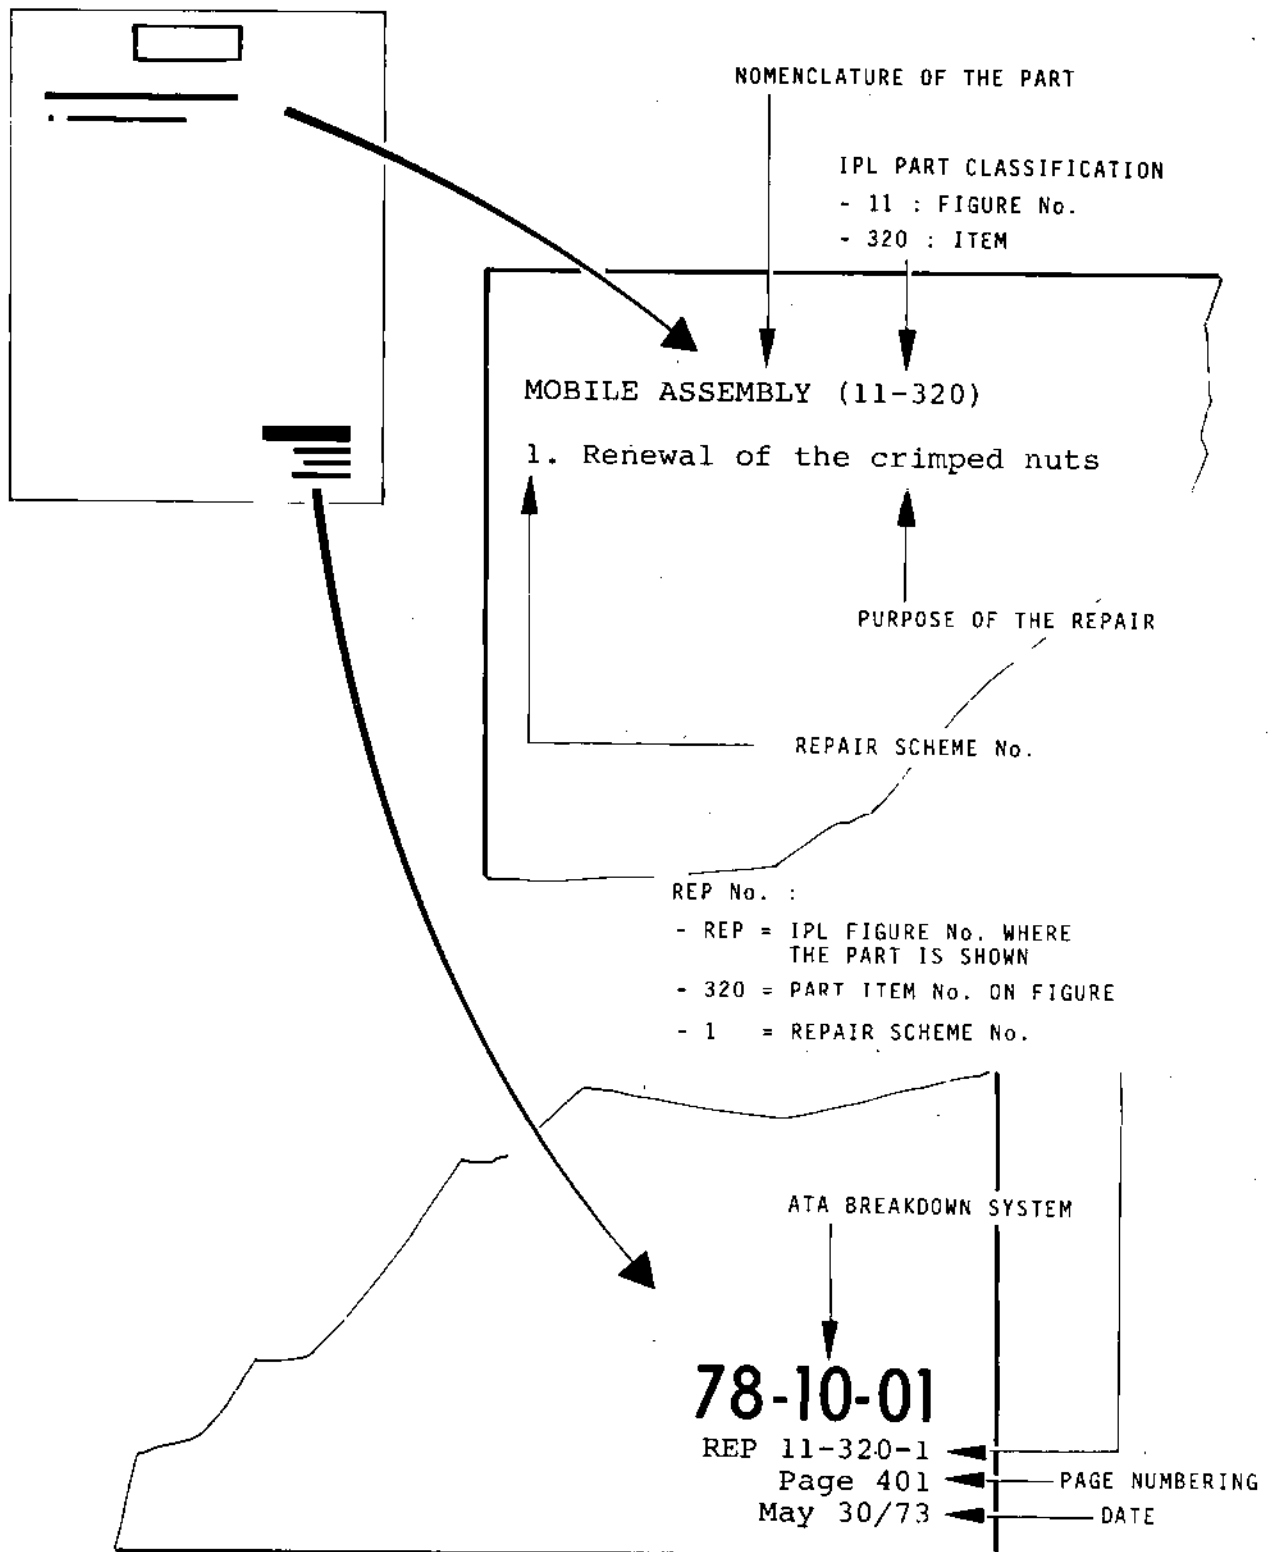

Page 401

FOREWORD  
Page 402  
Dec 30/74

OLYMPUS 593

MK.610-14-28  
OVERHAUL

NOTE : The REP numbering system uses the repair scheme identification criteria in order to establish the direct identification/classification relationship.

(4) Particular case

(a) Identical parts

When n identical parts are installed on a same assembly, the numbering of the REP will be made by using the IPL classification of the first part.

Example :

Identification of the  
thrust reverser cascades : CASCADE (2-10, 11, 30, 31,  
50, 51, 70, 90, 110, 111,  
130, 150, 170, 190)

REP No. : REP. 2-10-1

(b) Optional parts

In the case of the I.P.L. making mention of optional parts (OPT TO ...) and should these parts require a special repair scheme, the said scheme shall be identified as follows :

- 1 The nomenclature of the part with its IPL reference No. (Figure - Item) of the basic part (and, if required, the manufacturer's part number).
- 2 The purpose of the repair preceded by its numerical order number.  
  
and classified as follows :
- 3 A.T.A. breakdown system.
- 4 The number of the repair scheme which is given by the IPL classification of the basic part (Figure - Item) and the repair scheme numerical order number followed by an alphabetical variant.
- 5 Page numbered 401 and onward.
- 6 The date.

78-11-01

FOREWORD  
Page 403  
May 31/77

OLYMPUS 593

MK.610-14-28  
OVERHAUL

## 2. Updating

- A. The revisions, entailed by the technical evolution of the repair scheme, will affect its classification only as far as the date is concerned.
- B. Modification of the alternate part

An alpha variant is introduced in the IPL and modifies the figure-item No.

- (1) This modification has no effect on the repair scheme :  
the REP remains unchanged
- (2) This modification introduces a new REP :

Elaboration of a new repair scheme in which appears the alpha variant issue letter introducing this new REP.

Example : The modification introduces a REP with issue letter C, the previous REP is valid for the parts A and B.

REP 4-20-3 : valid for alpha variant A and B

REP 4-20C-3: valid from alpha variant C.

## A. General

In some instances, the fitting of a welded patch may necessitate the removal of riveted parts in order to facilitate the repair work or to comply with specifications related to installation of patches.

## B. Specifications related to patch installation

These specifications are given in chapter 70-35-10.  
Moreover, if deteriorations are located at less than 15 mm (0.591 in) from a riveted part, cut out the sheet metal so that patch fits snug in the riveted part.

## C. Patch preparation

- (1) Patches may be cut out from sound metal portions of any scrapped half deflector or manufactured from a piece of sheet metal P 3301, 0,6 mm (0.024 in) thick, pre-shaped to contour of area to be patch repaired (refer to figure 401).
- (2) Dimensions of patches are function of damages found. However, they must be formed in accordance with specifications given in chapter 70-35-10.

## D. Patch installation

- (1) As required, remove rivets fastening parts adjacent to the deteriorated zone in order to facilitate repair

**78-11-01**

REP 1-10-2

Page 401

work or to fit the patch element.

- (2) Argon arc weld the patch in accordance with instructions of chapter 70-35-10.
  - filler welding wire P 3002 or P 3009
  - weld class : B1
- (3) Inspect weld, class B1, as per instructions of chapter 70-35-80.
  - water washable fluorescent penetrant inspect as per process M 502 B of chapter 70-20-10.

E. Re-installation of previously unriveted parts

The following instructions give all pertinent information required for re-installation of unriveted parts.

- (1) For each case, two methods are provided :
  - 1st method : riveting as per drawing requirements for new parts
  - 2nd method : riveting with 0,8 mm (0.031 in) oversized diameter rivets in relation to nominal (original) dia. of rivets.
- (2) Preparation and riveting of parts is to be performed in accordance with instructions of chapter 70-50-10 and dimensional requirements shown on figure 401. Data concerning rivets are given in table I.

NOTA : Working lengthwise, radius the edges of the sheet metal to 0,2 mm (0.008 in.).
- (3) After riveting, inspect rivets in accordance with instructions of chapter 70-50-80.

A. Renewal of the riveted detail parts

- (1) Remove the riveted detail parts by grinding off their attaching rivets.
- (2) Inspect the rivets holes as instructed in chapter 70-50-10, "RIVETING" of the Standard Practices manual.
- (3) If necessary, counter drill both the component to be riveted and half-deflector to provide for installation of an oversized rivet.

NOTE : Working lengthwise, radius edges of the sheet metal to 0,2 mm (0.008 in.)

- (4) Re-install and rivet a new detail part as instructed in chapter 70-50-10, "RIVETING" of the Standard Practices manual and as indicated on figure 401, REP 1-10-2.

B. Inspect riveting

- (1) Ensure that rivets are properly installed, as instructed in chapter 70-50-80, "RIVETING" of the Standard Practices manual.

## A. General

In some instances, the fitting of a welded patch may require riveted parts to be removed in order to facilitate repair work or to comply with specifications related to installation of patches.

## B. Specifications related to patch installation

These specifications are given in chapter 70-35-10. Moreover, if deteriorations are located at less than 15 mm (0.591 in) from a riveted part, cut out the sheet metal so that patch fits snug with the riveted part.

In case of damage at the fuel collector, the bushing assy must be replaced and the surrounding area shall be repaired as per REP 1-100-4.

## C. Patch preparation

- (1) Patches may be cut out from sound metal portions of any scrapped deflector or manufactured from a piece of sheet metal P 3301, 0,6 mm (0.024 in) thick, pre-shaped to geometrical contour of area to be patch repaired (refer to figure 401).
- (2) Dimensions of patches are function of importance of damages found. However, they must be formed in accordance with requirements of chapter 70-35-10.

#### D. Patch installation

- (1) As required, remove rivets fastening parts adjacent to the deteriorated zone in order to facilitate repair work or locate the patch element.
- (2) Argon arc weld patch as per instructions of chapter 70-35-10.
  - Filler welding wire P 3002 or P 3009
  - Weld class, B2.
- (3) Inspect weld, class B2, as per instructions of chapter 70-35-80.
  - Water washable fluorescent penetrant inspect per process M 502 B of chapter 70-20-10
  - X ray inspect as per chapter 70-20-30.

#### E. Re-installation of the previously unriveted parts

- (1) The following instructions give all pertinent data required for re-installation of unriveted parts.
  - (a) For each case, two methods are provided :
    - 1st method : riveting as per drawing requirements for new parts
    - 2nd method : riveting using 0,8 mm (0.031 in) oversized diameter rivets compared to rivets of nominal diameter.
  - (b) Preparation and riveting of parts must be performed in accordance with instructions of chapter 70-50-10 and dimensional requirements shown on figure 401.  
Data concerning rivets are given in table I.  
NOTE : Working lengthwise, radius edges of sheet metal to 0,2 mm (0.008 in.).
  - (c) After riveting, inspect rivets in accordance with instructions of chapter 70-50-80.

#### F. Installation of retaining rings

- (1) Install the retaining rings as shown in figure 401, sheet 5.
- (2) Crimp the rings by flattening the rim of the rear reinforcement.
- (3) Ascertain that the rings do not rotate and/or do not slide in the recess.

A. Renewal of the riveted detail parts

- (1) Remove the detail parts by grinding off their attaching rivets.
- (2) Inspect rivet holes as instructed in chapter 70-50-10, "RIVETING", of the Standard Practices manual.
- (3) If necessary, counter drill both component to be riveted and half-deflector to provide for installation of an oversized rivet.

NOTE : Working lengthwise, radius edges of the sheet metal to 0,2 mm (0.008 in.).

- (4) Re-install and rivet a new detail part as instructed in chapter 70-50-10, "RIVETING" of the Standard Practices manual and as indicated on figure 401, REP 1-100-2.

B. Inspect riveting

- (1) Check that rivets are correctly installed, as instructed in chapter 70-50-80, "RIVETING", of the Standard Practices manual.

## A. General

This repair scheme calls for the front and rear stiffeners to be taken down and mounted back. Proceed as instructed in REP 1-100-2.

This repair scheme includes two types of repair :

- (1) Replacement of the sole fuel collector bushing assy as per paragraph B.
- (2) Repair of the bushing surrounding zone with replacement of the bushing as per paragraph C.

## B. Replacement of the bushing assy

- (1) Remove the damaged bushing by cutting out the deflector as shown in figure 401.
- (2) Using 0,6 mm (0.024 in) - thick sheet metal P 3301, make a connecting tube as shown in figure 401.

**78-11-01**

REP 1-100-4

Page 401

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) Make a repair bushing as per figure 401 and following instructions :
- (a) Install the coupling nut.
  - (b) Adjust the connecting tube to the nozzle.
  - (c) Position the tube and argon are weld as per chapter 70-35-10.
    - 1 - Filler welding wire : P 3009 or P 3002
    - 2 - Class of weld : B2.
  - (d) Inspect B2 class welds as per chapter 70-35-80
    - 1 - Perform fluorescent penetrant inspection using water-washable product as per method M502B, chapter 70-20-10.
- (4) Install the bushing assy onto the half-deflector as per figure 401 and following instructions :
- (a) Position the bushing on the half deflector and draw the contour of the area to be cut out.
  - (b) Cut out the contour and adjust the bushing assy.
  - (c) Perform B2 class argon are weld as per chapter 70-35-10.
- (5) Carry out an inspection of class B2 welds as instructed in chapter 70-35-80 : "WELD INSPECTION".
- (a) A water washable fluorescent penetrant test by method M 502, chapter 70-20-10 "DYE PENETRANT INSPECTION".
  - (b) An X-ray inspection as described in chapter 70-20-30 "RADIOGRAPHIC INSPECTION".

C. Repair of the zone surrounding the bushing assy

- (1) Remove the damaged zone according to the procedure applied for patch segment installation and as instructed in chapter 70-35-10.
- (2) The patch segment must be cut out in 0,6 mm (0.024 in) thick sheet metal P 3301 to required dimensions and shaped as specified in REP 1-100-2.

OVERHAUL

- (3) Argon are weld the repair segment as per chapter 70-35-10.
- (a) Filler welding wire : P 3009 or P 3002
  - (b) Class of weld : B2.
- (4) Carry out an inspection of class B2 welds as instructed in chapter 70-35-80 : "WELD INSPECTION".
- (a) A water washable fluorescent penetrant test by method M502, chapter 70-20-10 "DYE PENETRANT INSPECTION".
  - (b) An X-ray inspection as described in chapter 70-20-30 "RADIOGRAPHIC INSPECTION".
- (5) Make and install a bushing assy as specified in paragraph B of this repair scheme.

D. Marking

- (1) Add "REP 4" next after the part number by method M 28 chapter 70-10-10 "MARKING".

REPAIR

FLEXIBLE SPACER ASSEMBLY (3-90)

1. Reconditioning of the spacer hinge pin by weld build up.

---

PARTS REQUIRED FOR REPAIR

---

Filler welding wire: P3009 (Z10CNT18)  
or P3022 (NC15Fe)

---

A. Machining.

- (1) Remove the existing weld bead by grinding without damaging the spacer hinge pin (see figure 401).

B. Weld reconditioning.

- (1) Argon arc weld the hinge pin to the spacer as per chapter 70-35-10.

(a) Filler welding wire: P3009 (Z10CNT18)  
or P3022 (NC15Fe)

(b) Weld class : B1

C. Inspection.

- (1) Inspect weld bead, class 1, as per chapter 70-35-80.

(a) Locally inspect using water-washable dye penetrant as per method M501B in chapter 70-20-10.

REPAIR

VENTILATION SHROUD (3-130)

1. Filler welding cracks in the outer metal sheet

---

PARTS REQUIRED FOR REPAIR

---

Filler welding wire P3002 or P3009

---

A. Weld-filling the cracks

- (1) Filler-weld the cracks as instructed in Chapter 70-35-10 : "WELDING", and as indicated hereunder :

Filler welding wire : P3002 or P3009  
Class of weld : B1

CAUTION : WHEN GRINDING BE CAREFUL NOT TO DAMAGE THE QUARTZ WOOL INSIDE THE SHROUD.

REMOVAL OF THE CRACKS MUST NOT LEAVE ANY GRIND MARKS BEHIND WITHIN THE AREA MARKED OUT IN FIGURE 401 ; SHOULD IT OCCUR, APPLY A PATCH AS INDICATED IN REP 3-130-2.

B. Inspection for soundness

- (1) Test the B1 class welds for soundness as instructed in Chapter 70-35-80 : "WELDING", and as indicated below :

Checking is by the water-washable dye penetrant process using Method M501B described in Chapter 70-20-10: "PENETRANT INSPECTION".

CAUTION : THE PENETRANT IS TO BE REMOVED WITH A CLOTH SOAKED IN ISOPROPYL ALCOHOL (P442) OR METHYL ALCOHOL (P185).

---

#### A. General

Cracks and burn marks are repaired by cutting out the damaged segment and applying riveted patches in its place. Patching may in some cases involve the removal of the riveted parts with a view to easier work or to meeting the particular requirements of patching.

#### B. Conditions of patching

- (1) If the damaged area lies within 15 mm (0.591 in.) of a riveted or crimped part, cut the patch out of the repair sheet in a shape that will hug the contours of that part.
- (2) In case of progressive deterioration underneath the front and rear reinforcement plates, unrivet them completely.
- (3) If the damage occurs in the heat-insulated area, take the requisite precautions to keep all undeteriorated quartz wool safe from impairment.

#### C. How to prepare patches

- (1) Patches can be cut from a sound portion of a discarded ventilation shroud or tailored from P3301 metal sheeting 0,4 mm (0.016 in.) in thickness in a shape matched to the contours of the surface segment to be reconditioned.
- (2) The patch size varies with the extent of the damage. Its shape must, however, meet the requirements laid down in Chapter "RIVETING", Section 70-50-10.

#### D. How to apply patches

- (1) If necessary, remove parts located in the damaged area for easier repair.
- (2) Rivet the patch on as instructed in Chapter "RIVETING" namely :

78-11-01

REP 3-130-2

Page 402

Jan 31/77

OLYMPUS 593

MK.610-14-28

OVERHAUL

§ 70-50-10 for the non-heat-shielded portion, and  
§ 70-50-20 for the heat-insulated portion  
and as indicated in figure 401.

NOTE : If a patch is applied in the heat-insulated segment, every care must be taken not to damage the quartz wool when drilling the rivet holes.

- (3) Check the riveting as instructed in Sections 70-50-80 and 70-50-82 of Chapter "RIVETING".

E. Reinstalling the parts removed

NOTE : The following also applies to a renewal of damaged items.

(1) General

The instructions given hereunder cover all particulars required for the reassembly of parts removed with a view to repairs.

For every riveting job, two alternative schemes may be considered :

Scheme 1 : Riveting as laid down for new items.

Scheme 2 : Riveting by the use of rivets with a diameter 0,8 mm (0.031 in.) larger than the original dia.

NOTE : In the latter case, drill the washers or riveting plate as required by the particular rivet dia.

(2) Assembly of parts

- (a) Riveted parts are prepared and their riveting carried out and checked, as instructed in Chapter "RIVETING", Sections 70-50-10 and 70-50-80, and as indicated in figure 402.
- (b) For crimped parts, follow the indications in figure 402, and ascertain after crimping that the part is not cracked.

## REPAIR

### VENTILATION SHROUD (3-130)

3. Repairing the heat insulating metal sheet (heat shield) with resistance-welded patches

---

#### PARTS REQUIRED FOR REPAIR

---

Wafered metal sheeting	P3500, 0,1 mm (0.004 in.)
in thickness	
Smooth metal sheeting	P3301, 0,1 mm (0.004 in.)
in thickness	
Heat insulation	P3501

---

#### A. General

Burn marks on the heat shield are removed by cutting out the damaged portion and applying a resistance-welded patch in its place.

The ventilation shroud is so constructed as to require the patch to be welded on without removal of the heat insulation. The operation can be carried out by the use of a welding unit of the type : M10DZ0101

BRONZAVIA AERONAUTIQUE  
2, rue Jean Perrin  
92000 NANTERRE - FRANCE

#### B. Conditions of patching

- (1) These conditions are laid down in Chapter "WELDING", Section 70-35-20. Moreover, if the damaged area lies within 15 mm (0.591 in.) of a rivet the patch must be so shaped as to allow for the shape of the rivet.
- (2) In case of progressive deterioration underneath the different riveted parts unrivet them partially for repair.

NOTE : If such progressive damage occurs underneath the upstream and downstream reinforcing plates, they can be wholly unriveted.

#### C. How to cut out the part under repair

- (1) The part to be repaired is to be cut out as instructed in Chapter "WELDING", Section 70-35-20.

78-11-01

REP 3-130-3\

Page 401

Apr 30/93

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (2) Check the condition of the heat-insulating quartz wool. Should it be found impaired by burns, the damaged portion must be renewed.

D. How to prepare patches

- (1) Patches can be cut either from a sound portion of the heat insulating metal sheet of a discarded ventilation shroud or out of a wafered repair sheeting P3500.
- (2) The patch size varies with the extent of the damage. Its shape must meet the requirements laid down in Chapter "WELDING", Section 70-35-20.
- (3) Patches must be cut to allow for a min. 10 mm (0.394 in.) overlap, and in such a way that the corrugations on the patch exactly match those on the ventilation shroud.
- (4) If required, cut a piece of heat-insulating (P3501) quartz wool so that it fits snugly into its housing.

E. Welding patches

(1) Welding-kit parts and adjustment

- (a) The unit must feature an electrode of the same design as that shown in figure 401. This shape prevents the metal sheet from being perforated in welding.
- (b) Adjustments are made by reference to the operating instructions supplied with the unit, and verified on a test sample.

(2) Welding tryout on test sample

- (a) Before welding patches on, a test sample is to be welded to verify the adjustments made.
- (b) The welding sample is made up of two P3500 wafered sheet-metal strips 100 x 30 mm (3.937 x 1.181 in.) in size. The test sample must be cleaned and welded in the same way as the part under repair. It must carry at least 5 weld spots.
- (c) The test sample is checked by peeling off the weld spots.

78-11-01

REP 3-130-3  
Page 402  
Jan 31/77

OLYMPUS 593

MK.610-14-28  
OVERHAUL

The test sample is considered up to the mark if all weld spots peel off.

(3) Preparing the parts before welding

- (a) Fine-buff the area of overlap both on the patch and the shroud.

CAUTION : WHEN BUFFING, PROTECT THE ADJOINING AREAS TO KEEP THE QUARTZ WOOL SAFE FROM DAMAGE.

- (b) Clean the surfaces to be welded as instructed in Chapter "WELDING", Section 70-35-20.

(4) Welding on patches

- (a) If necessary, position the quartz wool.  
(b) Make perfect contact between the portions to be welded.

CAUTION : IMPERFECT CONTACT MAKES FOR EXCESSIVE WELDING PRESSURE, RESULTING IN THE PERFORATION OF THE METAL SHEETS.

- (c) Weld the patch on by stitch welding (see figure 401)

NOTE : Use a flat-tip electrode.

Connect the reverse current clip as close as possible to the area of welding.

F. Inspection

- (1) Check each part visually to make sure there is no burn mark or hole in the metal sheet.

REPAIR

SPHERICAL JOINT BOX (4-50,100)

1. Re-shaping of the attaching flange

---

PARTS REQUIRED FOR REPAIR

---

A. Re-shaping

- (1) Working at room ambient temperature, re-shape the spherical joint box attaching flange by means of a mallet.

B. Inspection for soundness

- (1) Inspect box assembly per fluorescent penetrant indirect post emulsified process M 504 B of chapter 70-20-10.

Scrap box if any crack is found.

C. Dimensional check

- (1) Check that the box flange does not show flatness defect exceeding 0,2 mm (0.008 in).

ANGULAR POSITION STOP (4-60)

1. Re-shaping

---

PARTS REQUIRED FOR REPAIR

---

A. Re-shaping

- (1) Rest the part on hardwood blocks and, using a mallet, re-shape the stop at room ambient temperature.

B. Inspection for soundness

- (1) Inspect the stop assembly per post-emulsified fluorescent penetrant process M 504 B of chapter 70-20-10.  
Scrap the stop assembly if any crack is disclosed.

C. Dimensional check

- (1) Check that distance between planes P1 and P2 is within the values specified on figure 401.

CONNECTING LINK (4-120)

1. Re-shaping

---

PARTS REQUIRED FOR REPAIR

---

---

CAUTION - THIS RE-SHAPING IS TO BE PERFORMED ONLY ONCE DURING THE SERVICE LIFE OF THE SUBJECT PART.

A. Re-shaping procedure

Rest the ends of the connecting link on steel blocks positioned under a screw press and re-shape the link by exerting with the press a progressive load, applied exclusively in opposite direction of the link distortion, until sag falls within tolerance (refer to figure 401).

CAUTION - IF IT HAPPENED THAT LINK DISTORTION (BUCKLING) BECOMES REVERSED IN RELATION TO WHAT IT WAS ORIGINALLY, SCRAP THE LINK.

B. Inspection for soundness

Detect eventual cracks by performing X ray inspection in accordance with instructions of chapter 70-20-30.

Any crack entails scrapping the link.

C. Dimensional check

Ensure that buckling is less than 0,3 mm (0.012 in) (refer to figure 401).

D. Marking

Under the part number, mark REP 4-120-1 as per method M 28 of chapter 70-10-00.

thickness 1 mm (0.039 in.)  
Filler welding wire P 3002 or P 3009  
Brazing wire P 3152 and flux P 3191 or P 3192

---

A. Requirement related to installation of tube segments

- (1) Minimum distance between two weld beads to be 10 mm (0.394 in).
- (2) Cutting through in an existing weld bead is permissible.

B. Preparation of a tube segment

- (1) The tube segment to be installed must be cut either from :
  - a scrapped fuel collector tube,
  - a piece of tube P 3400, dia. 16 mm (0.630 in) thickness 1 mm (0.039 in) for the straight portions of tube.

C. Installation of a tube segment

- (1) Fit the tube segment to dimensional requirements shown on figure 401.
- (2) Using argon arc welding method, tackweld and weld the tube segment as per instructions of chapter 70-35-10.
  - Filler welding wire P 3002 or P 3009
  - Weld class B2.

ANTI-SCREECH LINER (5-10)

3. Liner patch weld repair

---

PARTS REQUIRED FOR REPAIR

---

Bare anti-screech liner No. 525-600-081-0 (4470 holes)  
or No. 525-600-033-0 (4700 holes)

Sheet metal P 3320, 1 mm (0.039 in) in thickness

Filler welding wire P 3020

Spacer No. 525-600-101-0

Rivet No. 525-203-162-0

---

CAUTION - TWO TYPES OF LINER ARE CURRENTLY AVAILABLE (4700 HOLES OR 4470 HOLES). AS A RESULT, MAKE SURE THAT SELECTED PATCHES ARE MATCHED WITH TYPE OF LINER CONCERNED.

A. Requirements concerning patch installation

These requirements are given in chapter 70-35-10.  
Furthermore, liner cutting must be done between two rows of holes.

NOTE - It is permissible to plug weld one (1) hole in each of the patch corner radius area.

B. Patch preparation

- (1) Patches must be cutted from sound metal portion of a scrapped liner or from a new liner or from a piece of sheet metal P 3320, 1 mm (0.039 in) thick, shaped to fit the contour of area to be patch repaired (refer to figure 401).
- (2) Shape of patches
  - (a) For minor deterioration close to an attaching hole, cut a circular patch, 35 mm (1.378 in) in diameter.
  - (b) For all other cases, shape to be given to patches must comply with requirements of chapter 70-35-10.

  - Water washable fluorescent penetrant inspect per process M 502 B, chapter 70-20-10.
  - Perform X-ray inspection per chapter 70-20-30.
- (3) Plane grind welds lightly.
- (4) Inspect welds for soundness using water washable fluorescent penetrant process M 502 B, chapter 70-20-10.
- (5) When patches made from sheet metal pieces are involved, the following operations may be required :
  - (a) At locations shown on figure 401, perform stamping, using tooling SC 139.
  - (b) Drill the air passage holes and attachment holes for spacers.
  - (c) Round off or blend edges of holes by smoothing edges lengthwise ; blend radius :  
0,5 mm (0.020 in).  
Finished surfaces obtained by smoothing hole edges lengthwise, must be free from radial tool marks.

D. Spacer installation (as applicable)

If required, locate and rivet one or several spacers in compliance with instructions given in repair scheme REP 5-10-2.

REPAIR

ANTI-SCREECH LINER (5-10)

4. Renewal of one or several liner corrugations

---

PARTS REQUIRED FOR REPAIR

---

Bare anti-screech liner No. 525-600-081-0 (4470 holes)  
or No. 525-600-033-0 (4700 holes)

Filler welding wire P 3020

Spacer No. 525-600-101-0

Rivet No. 525-203-162-0

---

CAUTION - TWO TYPES OF LINER ARE CURRENTLY AVAILABLE (ONE WITH 4700 HOLES, THE OTHER FEATURING 4470 HOLES). CONSEQUENTLY, MAKE SURE THAT CORRUGATIONS SEGMENTS USED FOR REPAIR ARE MATCHED WITH THE TYPE OF LINER CONCERNED.

A. Cutting of the liner deriorated corrugations.

Cut out of one or more corrugations, depending on how large is the deterioration, is to be made so as weld beads are equally spaced between to rows of holes.

B. Preparation of the patched corrugation segments.

The patched corrugations are cutted out from sound portion of a scrapped liner or from a new liner.

C. Installation of patched corrugations

(1) Argon arc weld corrugations in accordance with instructions of chapter 70-35-10.

- Filler welding wire P 3020
- Weld class B2

(2) Inspect welds, class B2, in accordance with instructions of chapter 70-35-80.

- water washable fluorescent penetrant inspection as per process M 502 B of chapter 70-20-10.
- x-ray inspection per chapter 70-20-30.

(3) Plane grind welds slightly

CAUTION : COMPLIANCE WITH THE WELDING REQUIREMENTS GIVEN IN  
THIS REPAIR IS ESSENTIAL  
NO DEVIATION FROM THESE REQUIREMENTS IS ALLOWED.

A. Introduction.

This repair scheme applies when the following damage are present :

- Cracks affecting assembly weld seams (welded joints) of flanges, bosses and liners.
- Cracks emanating from a weld seam or from a hole edge and progressing through sheet metal of liners provided they do not feature ramifications and are not located within a burnt area.

B. Weld-Filling the Cracks.

- (1) Fill weld cracks as instructed in chapter 70-35-10.

NOTE : If crack originates from a hole, plug weld the hole in the same conditions as for the cracks, then drill hole again as specified on Figure 401 of repair scheme REP 5-240-3.

CAUTION : COMPLY WITH THE WELDING REQUIREMENTS BELOW :

1. FILL WELD CRACK AS PER CHAPTER 70-35-10 PARA. 5.A.(3).
2. ARGON ARC WELD, CLASS B2.
3. FILLER WELDING WIRE P 3020, DIA. 1, 2 MM (0.047 IN.)  $\pm$  30 %.

C. Inspection of Welds.

(1) Inspect welds, class B2, as per chapter 70-35-80.

- water washable fluorescent penetrant inspect per process M 502 B, chapter 70-20-10.
- X-ray inspect per chapter 70-20-30.

CAUTION : FOR WELD INSPECTION, COMPLY WITH THE FOLLOWING REQUIREMENTS :

1. ACCEPTANCE CRITERIA FOR VISUAL EXAMINATION AND DYE PENETRANT TEST AS PER CHAPTER 70-35-80.
2. ACCEPTANCE CRITERIA FOR X-RAY EXAMINATIONS AS PER 70-35-80.

3. X-RAY INSPECTION TECHNICAL DATA :

**CAUTION:** COMPLIANCE WITH THE WELDING REQUIREMENTS GIVEN IN THIS REPAIR IS ESSENTIAL. NO DEVIATION FROM THESE REQUIREMENTS IS ALLOWED.

**A. Requirements for Patch Installation.**

These requirements are given in chapter 70-35-10.

**NOTE:** If a patch is to be installed somewhere around strengthened areas adjacent to front and area duct flanges, and only in this circumstance, the welding of the subject patch may interfere with the existing flange/duct liner welded joint.

**B. Patch preparation.**

- (1) Patches prepared for repair of the duct strengthened areas (refer to Figure 401) must be cutted out from new liners or from sound portions of a scrapped reheat duct.
- (2) Patches to be used for repair of duct areas with constant thickness, must be cutted out from sheet metal P 3320, 1,5 mm (0.591 in.) in thickness, or from sound portion of a scrapped reheat duct.
- (3) Patch dimensions will be a function of damage to repair. However, their shape must comply with requirements of chapter 70-35-10.

**C. Patch Installation****78-11-01**

REPAIR

REHEAT DUCT (5-240)

4. Reconditioning the Front and Rear Flanges Outer Contact Surfaces through Metal Spraying (Metallizing).

---

PARTS REQUIRED FOR REPAIR

---

Cobalt alloy powder (fine)	P 3205
Nickel/Aluminium powder	P 3203

---

A. General.

- (1) Depending on the extent of the defect, it may be necessary to apply an undercoat before spraying of the final coat.

The total thickness of the coating must not exceed 1,3 mm (0.052 in.).

- (2) If the part has already been reconditioned through metal spraying, remove metallization as instructed under para. B.

B. Removing the deteriorated metallization.

- (1) Remove the damaged metallization by abrasive blasting according to method M 103 A in Chapter 70-15-20 "CLEANING AND REMOVAL OF COATINGS".

NOTE : Omit the degreasing operation. Protect the surfaces surrounding the area to be abrasive blasted using metal shields.

C. Dimensionally inspect the area to be metal sprayed

NOTE : This operation is required only if the outer contact surface was previously metallized.

- (1) Measure and record the average diameter of the flange outer contact surface.  
This check allows to determine the thickness of metal spraying required.
- (2) Checking method (Ref. Fig. 401).

78-11-01

REP 5-240-4

Page 401

Sep 30/78

OVERHAUL

CAUTION : A 10°C TEMPERATURE VARIATION RESULTS A  
0,13 MM (0.00512 IN.) LINEAR CHANGE ON THE  
FLANGE DIAMETER.

The average diameter of the spherical contact surface of the flanges is found by working out the arithmetical mean of the 18 values recorded in the plane P1.

Perform these measurements as follows :

- (a) On the external surface of the flange, mark 18 generatrices equally distributed on the flange half-circumference.

CAUTION : IN ANY CASE, MARKING MUST NOT IMPAIR THE SURFACE CONDITION OF THE SPHERICAL CONTACT SURFACE.

- (b) Using the resizing tool SC 118, restore the roundness of the flange.
- (c) Calibrate the TESA UNIMASTER gage (TESA - S.A. 1020. RENENS - VD/Switzerland - Agent in France : SYNERGIE, 29 avenue Philippe Auguste - 75540 PARIS CEDEX 11 - Tel: 44-93-10-00

Fit the gage with :

- 1 the extension tubes required for obtaining the dimension to be checked
  - 2 the supports - correctly adjusted - to ascertain the measuring plane.
- (d) Rest the gage supports on to the flange edge and measure.
- (e) Repeat this operation in line with the 18 marks.

D. Metallizing the flange outer contact surface

- (1) Prepare the area to be metal sprayed as instructed in Chapter 70-65-20 "SPRAYING OF COATINGS USING A PLASMA TORCH".

NOTE : Perform dry abrasive blasting using corundum 160 (P 137) at a pressure of 3,5 bars (51 psi).

78-11-01

REP 5-240-4

Page 402

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Carry the metal spraying as instructed in Chapter 70-65-20 "SPRAYING OF COATINGS USING A PLASMA TORCH" in compliance with the requirements shown on Figure 402 and the following additional instructions :

- (a) Spraying of an undercoat, if applicable :  
Nickel/aluminium powder P 3203  
Maximum coat thickness 1 mm (0.039 in.)
- (b) Spraying of final coating :  
Cobalt alloy powder material P 3205  
Maximum coat thickness 0,3 mm (0.012 in.)

NOTE : Carefully blend out the metal coating at one end by thinning out the metallization as shown on Figure 402.

- (3) If required, smooth the surface discontinuities by sanding with an emery cloth.

#### E. Inspection

- (1) Inspect the metallization as specified in Chapter 70-65-80 "INSPECTION OF COATINGS".
- (2) Dimensionally inspect the flange outer contact surface as indicated in Figure 402.  
The inspection method is similar to that defined under para C. (2).

#### F. Marking

- (1) Following the part number, mark "REP 4" as per method M 28 of Chapter 70-10-10 "METHODS OF MARKING".

5. Reconditioning Tapped Holes in Bosses through Bush Installation

---

PARTS REQUIRED FOR REPAIR

---

Stock bar P 3623 (KC 20 WNx)  
Weld filler wire P 3020 (KC 20 WNx)

---

A. Machining

- (1) Drill, spot-face and tap the defective tappings as instructed in Figure 401.
- (2) Machine the required bushes from stock bar P 3020, as indicated in Figure 402.

B. Installing the bushes

- (1) Locate the bushes after having their external screw thread lightly coated with lanolin (P 194).
- (2) Using a drill, produce two diametrically opposed indentations as specified in Figure 401, sheet 2 of 2.
- (3) Argon-arc plug weld the above indentations as instructed in Chapter 70-35-10.
  - (a) Filler welding wire P 3020
  - (b) Weld class B1
- (4) Inspect the welds, class B1, as instructed in Chapter 70-35-80.
  - (a) Water washable fluorescent penetrant inspect as per method M 502 B in Chapter 70-20-10.
- (5) Grind the weld points and the bush faces flush with the boss surface (inner and outer).

PRINTED IN FRANCE

9. Reshaping the front and rear flanges

---

PARTS REQUIRED FOR REPAIR

---

A. Inspection for soundness

- (1) Make sure that the distorted zone is free from any crack. Perform fluorescent penetrant inspection using water-washable product as per method M503 B in chapter 70-20-10.

B. Reshaping the front or rear flange

- (1) Smooth the sharp edges located in the distorted zone using crocus cloth.
- (2) Re-shape the flange concerned by peening. The treated zone must be first heated up to 600°C approximately.
- (3) Inspect the re-shaped zone for soundness by :
  - (a) Localized fluorescent penetrant inspection using water-washable product as per method M502 B in chapter 70-20-10.
  - (b) X-ray inspection of the welds as specified in chapter 70-20-30.
- (4) Check the reheat duct dimensions as specified in figure 401.
  - (a) Checking method of the flange average diameter.

MK.610-14-28  
OVERHAUL

CAUTION : A 10°C TEMPERATURE VARIATION RESULTS  
IN A LINEAR CHANGE OF THE FLANGE DIA-  
METER AMOUNTING TO 0,13 MM (0.00512 IN.)  
APPROXIMATELY.

The average diameter of the spherical contact  
surface of the front or rear flange is obtained  
by working out the arithmetical mean of the 18  
values recorded in the plane P1 or P2.

Perform these measurements as follows :

- 1 On the front external surface of the flange,  
mark 18 generatrices equally distributed on  
the flange half-circumference.

CAUTION : MARKING MUST NOT, IN ANY CASE,  
IMPAIR THE SURFACE CONDITION OF  
THE SPHERICAL CONTACT SURFACE

- 2 Using the resizing tool SC 118, restore the  
roundness of the front and rear flange of the  
reheat duct.
- 3 Calibrate the TESA UNIMASTER (TESA - S.A. 1020  
RENENS - VD/Switzerland - Agent in France :  
SYNERGIE, 29 Avenue Philippe Auguste,  
75540 PARIS CEDEX 11 - Tel: 44-93-10-00

Fit the gauge with :

- a the extension tubes required for obtaining  
the dimension to be checked.
- b the supports, correctly adjusted, to ascer-  
tain the measuring plane.
- 4 Rest the gauge supports onto the flange edge  
and measure.
- 5 Repeat this operation in line with the 18  
marks.

C. Sandblasting.

(1) Sandblast the spherical contact surface of the flange as instructed below and as shown in figure 402.

- (a) Clean the part with trichlorethylene vapour as per method M101A in chapter 70-15-20.
- (b) Sandblast as per method M103A in chapter 70-15-20.

CAUTION : COMPLY WITH THE FOLLOWING REQUIREMENTS :

- QUARTZ 160 (S14)
- INTENSITY : F10 A2
- AUTOMATIC MACHINE

NOTE : The sandblasting parameters applied by SNECMA are the following :

- Rotational speed of the supporting plate :  $3 \text{ rpm} \pm 20 \%$
- Travelling speed of the gun :  $1,3 \text{ m/s} \pm 20 \%$

- (c) Inspect the condition of the flange spherical contact surface

CAUTION : REQUIRED CHECK :

CHECK SPHERICAL SURFACE FOR EVEN SANDBLASTING. NON-SANDBLASTED ZONES AND SWEEPING MARKS INDICATIVE OF UNSUITABLE NOZZLE INCIDENCE ANGLE, ARE NOT ACCEPTABLE.

D. Dimensional check

Check the reheat duct dimensions as indicated in figure 401.

## ASSEMBLY

### 1. General

- A. During assembly, follow the recommendations given in chapter 70-65-00 of the manual of Standard Practices and the working procedures of the Overhaul manual.
- B. Use only tools and other special equipment nominated in the assembly procedures, and identified by a number SC... The tools are shown in the Illustrated Tools and Equipment Manual (I.T.E.M).
- C. When assembling bolts and nuts, refer to pages 601-700 of the "Fits and Clearances" chapter for :
  - (1) The tightening torque for the bolt or nut.
  - (2) The lubrication to be applied to the nut or the bolt before fitting.
- D. The clearances to be checked during assembly are identified by a number. Refer to pages 601-700 of the "Fits and Clearances" chapter for the values which must be respected.
- E. In the working procedures section of the manual, parts are referenced to the I.P.C by two numbers in brackets, the first of which is the figure number in the I.P.C., the second being the item number within that figure.
- F. Torques should be applied with a torque spanner accurate to  $\pm 5\%$ .

### 2. Location

The reheat duct is assembled so as to be suitable for left-hand dressed engines i.e. 1 and 3 (see fig. 501).

It can be prepared for installation on a right-hand dressed engine by changing the position of the connecting link.

This is stated for information only, the details of the operations are given in the Maintenance manual.

### 3. Preparation for assembly

- A. Recommendations

OVERHAUL

During assembly, coat the following parts with anti-seizing graphite grease (Pl89) :

- (1) Threads of bolts and nuts.
- (2) Sliding parts.
- (3) Any surfaces likely to suffer fretting (slides, spacers, ventilation shroud flexible mountings etc).

B. Preparation of ventilation shroud (3-130)

NOTE : The ventilation shroud is assumed to be in the vertical position on a stand.

- (1) Position the assembled flexible spacers (3-90).
- (2) Fit the internal plate (3-120).
- (3) Enter from the inside, the 12 point head bolts (3-110) and fit the self-locking nuts (3-100).
- (4) Torque tighten to the prescribed value.
- (5) Position the covers (3-70) on the outside of the shroud.
- (6) Fit hexagon head bolts (3-50) complete with flat washers (3-60).
- (7) Torque tighten to the prescribed value.
- (8) Fit washers (3-40) and hexagon head bolts (3-30), from the inside, to the ventilation shroud on either side of the vertical centre line.
- (9) Fit washers (3-20) on the outside and fix with self-locking nuts (3-10).
- (10) Torque tighten to the prescribed value.

C. Preparation of the reheat duct (5-240)

- (1) Place the reheat duct on the build stand - tool SC77 -
  - (a) Using bars - tool SC207 - and lifting beam - tool SC210 - lift and tilt the reheat duct.
  - (b) Lower the reheat duct in the horizontal position onto build stand - tool SC77 -
  - (c) Remove the handling tools - SC207 and SC210.

OVERHAUL

- (2) Fitting clamp support (5-230)
    - (a) Fit hexagon head bolts (5-210) and washers (5-220) from the inside of the reheat duct.
    - (b) Position the clamp support (5-230) and fit self-locking nuts (5-200).
    - (c) Torque tighten the bolts to the prescribed value.
  - (3) Fitting mounting lugs (5-160)
    - (a) Fit washers (5-190) and hexagon head bolts (5-180) from the inside of the reheat duct.
    - (b) Position the mounting lugs (5-160) and fit self-locking nuts (5-170).
- NOTE : Attention to the orientation of the mounting lugs, the open end should be towards the front of the duct.
- (c) Repeat operations (a) and (b) for each of the ten mounting lugs (5-160).
  - (d) Tighten the bolts to the prescribed torque.
- (4) Fitting of lifting ring (4-240)
  - (a) Fit washers (4-230) and hexagon head bolts (4-220) from inside the reheat duct.
  - (b) Position the lifting ring (4-240) and fit self-locking nuts (4-210).

NOTE : The tightening of these nuts is carried out in a later operation, to ease the fitting of one of the anti-screech liner fixing nuts (see fig. 501).

#### 4. Final assembly

##### A. Fitting the anti-screech liner

- (1) Assemble slides (5-150) to the anti-screech liner (5-10) and retain them with 30 location pins - tool SC78 -
- (2) Insert the anti-screech liner into the pre-assembled reheat duct.

78-11-01

OVERHAUL

- (3) Locate the reheat duct/anti-screach liner assembly by two conical pins - tool SC15 - at the forward mounting points.
- (4) Fitting spacers (5-140) and their attachment parts (see fig. 502).
  - (a) Using a lever - tool SC17 - and assembly clips - tool SC 79 - position spacers (5-140) between the anti-screach liner and the reheat duct.
  - (b) Using a bar - tool SC15 - check the alignment of the holes in the liner, spacer and reheat duct.
  - (c) Fit bolt (5-70 or 5-100) from the inside of the duct.
  - (d) On the outside fit the locking plate (5-80 or 5-110) and either blind nut (5-60) (on corrugations number 14 to 18) or hexagonal nut (5-90) (on corrugations 2 to 11 and 21 to 1).

NOTE : To ease the assembly, secure the liner at 4 equispaced points, then at the mid point of each sector, and so on until all 30 points are secured.

- (e) Fit the lifting rings (5-50) to corrugations 12-13 and 19-20 with bolts (5-30), locking plates (5-40) and blind nuts (5-20).

ATTENTION : CHECK THAT BLIND NUTS (5-20) AND (5-60) ARE FITTED ON CORRUGATIONS 12 TO 20 (see fig. 502).

- (5) Assembly of rear mounting points
  - (a) Fit a locking plate (5-130) and hexagon head bolt (5-120) to each slide (5-150).
  - (b) Withdraw the locating pin - tool SC78 - and fit the second hexagon head bolt (5-120).
  - (c) Repeat operations (a) and (b) for 28 fixing points on corrugations 2 to 14 and 17 to 1 (see fig. 502).

78-11-01

Page 507  
Dec 30/74

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (d) Fix the two slides on corrugations 15 and 16, each by a hexagon head bolt (5-120) and a locking plate (4-170) (see fig. 503). Remove locating pin - tool SC78 -

NOTE : Final assembly is carried out simultaneously with the assembly of the fuel collector tube.

- (6) Fit the fuel collector tube (4-130) and fix it with two hexagon head bolts (4-160) (see fig. 503).  
(7) Tighten all the anti-screach liner attachment points to 1,5 m daN (11.06 lbf. ft.).  
(8) Seat the parts together by tapping lightly on the head of each bolt with a mallet until the tightening to 1,5 m daN (11.06 lbf. ft.) is firm and consistent.  
(9) Un-screw all the attachment points and re-torque to the prescribed value.

NOTE : During tightening of the bolts, retain the locking plates in position with tool SC18.

- (10) Tighten the lifting ring (4-240) retaining bolts (4-220) to the prescribed torque value.  
(11) Lock all bolts.  
(12) Position the front collector tube clamp (4-150), fit the 12 point head bolts (4-140) and tighten to the prescribed torque.  
(13) Lock bolts (4-140) with 0,8 mm (0.031 in.) dia. lock wire (NC 15 Fe).  
(14) Fitting the connecting link (4-120) (see fig. 504).  
(a) Fit the spherical bearing housing (4-50) to the reheat duct vertically beneath corrugations 18-19 (see figure 502).  
(b) Position the angular position stop (4-60) on the spherical bearing housing (4-50).  
(c) Fit hexagon head bolts (4-10) and (4-30) complete with tab washers (4-20) and (4-40).

78-11-01

Page 508  
Dec 30/74

OLYMPUS 593

MK.610-14-28

OVERHAUL

NOTE : When fitting the tab washers, ensure that the tabs are entered in the appropriate holes.

- (d) Tighten the bolts to the prescribed torque and lock. (Refer FITS AND CLEARANCES page 603).
  - (e) Fit one end of the connecting link (4-120) with an anti-roll housing (4-110), spherical bearing housing (4-100), hexagon head bolts (4-80) complete with tab washers (4-90). Secure with slave nuts (4-70).
  - (f) Fit the connecting link by engaging the end in the spherical bearing housing (4-50), at right-angles to the axial centre line of the reheat duct. Then rotate it by 90°, thus placing it in the working position.
  - (g) Fit protector - tool SC19 -
- (15) Position the support (4-200) on the reheat duct vertically beneath the corrugations 13-14 (see fig. 502).
- (a) Fit hexagon head bolts (4-180) complete with tab washers (4-190).

NOTE : Ensure that the tabs of the washers are entered in the appropriate holes.

- (b) Tighten the bolts to the prescribed torque and lock.

B. Fitting the ventilation shroud (2-10)

- (1) Place the reheat duct, front flange downwards, on work table - tool SC211 - using bars - tool SC207 - and lifting beam - tool SC210.
- (2) Position the 10 spades - tool SC14 - on the reheat duct in order to guide the mounting lugs (5-160).
- (3) Compress the flexible spacers (3-90) on the shroud using 8 clamps - tool SC13 -
- (4) Fit clamps - tool SC11 - to the ventilation shroud (2-10).
- (5) Lift the ventilation shroud with a hoist and a 3 branch sling and fit it over the reheat duct. Lower the ventilation shroud and rest it on the brackets on the work table - tool SC211 -

78-11-01

OVERHAUL

- (6) Fitting the lower half-deflector (1-100).
  - (a) Fit the hexagon head bolts (1-160), complete with washers (1-170) from the inside of the reheat duct and position the half deflector (1-100).
  - (b) Fit bushes (1-180) and self-locking nuts (1-150).
  - (c) Couple the fuel collector tube (4-130) to the half deflector (1-100) with the connecting nut.
  - (d) Tighten the connecting nut to the prescribed torque using - tool SC20 - at the same time holding the union body with a flat spanner.  
Lock with 0,8 mm (0.0315 in) NC 15 Fe locking wire.
  - (e) Fit hexagon head bolts (1-120) complete with washers (1-130) from the inside of the reheat duct.
  - (f) Position the lifting rings (1-140) and fit self-locking nuts (1-110).
  - (g) Tighten the bolts to the prescribed torque.
- (7) Fitting the upper half-deflector (1-10).
  - (a) Fit hexagon head bolts (1-70) complete with washers (1-80) from inside the reheat duct and position the half-deflector (1-10).
  - (b) Position the bushes (1-90) and fit self-locking nuts (1-60).
  - (c) Fit hexagon head bolts (1-30) complete with washers (1-40).
  - (d) Position the lifting ring (1-50) and fit self-locking nuts (1-20).
  - (e) Tighten bolts to the prescribed torque.
- (8) Raise the ventilation shroud, align the mounting bracket and shroud holes, having removed the spades - tool SC14 -
- (9) Fit the 12 point head bolts (2-20) complete with washers (2-30).
- (10) Remove clamps - tool SC13
- (11) Tighten the bolts to the prescribed torque.

## FITS AND CLEARANCES

### 1. General

#### A. Layout

- (1) The table of clearances gives the machining tolerances of parts in new condition and acceptable wear limits. The values are expressed in millimeters.

ITEM FIG.	IPL FIGURE ITEM	NOMINAL DIMENSION	TYPE	CLEARANCES		MAX LIMIT	CAT.	REMARKS SELECTIONS
				MIN	MAX			
1	2	3	4	5	6	7	8	9

- (2) The item numbers in column (1) by reference to the corresponding figure provide a means of locating the clearance or dimension to be measured.
- (3) The item numbers in column (2) identify the parts in the "Illustrated Parts List". (FIGURE + ITEM).
- (4) Column (3) gives the manufacturing dimensions of parts together with the machining tolerances.
- In the case of two parts which form an assembly the first one is always the male part.
- (5) The code letters in column (4) indicate the type of clearance.
- A denotes an axial clearance
  - D denotes a diametral clearance
  - L denotes a side clearance
- (6) Columns (5) and (6) give the clearance (symbol J) or the interference (symbol S) which result from the manufacturing tolerances.

Column (9) is used to indicate that a smaller clearance than that resulting from the manufacturing tolerances is required. This reduced clearance is obtained by selective assembly of parts.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (7) The digits or letter in column (8) give the clearance category the definition of which is as follows :

- M - Check or adjustment to be carried out at each assembly
- 1 - Check to be systematically carried out
- 2 - Check to be carried out if the condition of parts makes it necessary.
- 3 - Dimensions intended for use by Design Offices (not applicable in this document).
- 4 - Check to be systematically carried out on the equipments intended for ageing studies (Sampling)

B. Max. after wear (column 7)

- (1) The MAX. LIMITS are the maximum wear limits within which a part can be accepted for a further period of use.
- (2) Parts worn beyond these limits will be either repaired in accordance with the instructions given in chapter "REPAIR" or replaced as applicable.
- (3) Therefore the values given in this column will change as experience is gained with the repaired equipment or the equipment intended for ageing studies.
- (4) This kind of information may be entered in this column

(a) Clearance

The maximum clearance or the minimum interference between two parts will be given only if they are matched parts. The distribution of this clearance on the male or female part is left to the discretion of the repairer.

(b) Dimension

In order to preserve interchangeability, the degree of permissible wear on male and female parts is given, thus ensuring a correct assembly at all times whatever the mating parts may be.

**OLYMPUS 593**

MK.610-14-28

OVERHAUL

## 2. Torque values

As torque is variable with respect to lubrication, we indicate in this paragraph both the torque and lubrication to comply with during assembly. Bolts, nuts... bear the I.P.L. references.

Bolts or nuts Fig. Item (I.P.L.)	Lubrication when assembly	Torque value
1-20, 60	Lubricate thread with anti-seizing graphite grease (P189)	0,6 daN.m (4.42 lbf.ft)
1-100	Lubricate thread of the union nut with anti-seizing graphite grease (P189)	1,9 daN.m (14 lbf.ft)
1-110, 150	Lubricate thread with anti-seizing graphite grease (P189)	0,6 daN.m (4.42 lbf.ft)
2-20	Lubricate thread with anti-seizing graphite grease (P189)	0,6 to 0,65 daN.m (4.42 to 4.79 lbf.ft)
3-10	Lubricate thread with anti-seizing graphite grease (P189)	0,6 daN.m (4.42 lbf.ft)
3-50	Lubricate thread with anti-seizing graphite grease (P189)	0,95 to 1,05 daN.m (7 to 7.74 lbf.ft)
3-100	Lubricate thread with anti-seizing graphite grease (P189)	0,26 to 0,28 daN.m (1.91 to 2.06 lbf.ft)
4-10, 30, 80	Lubricate thread with anti-seizing graphite grease (P189)	1 to 1,1 daN.m (7.37 to 8.11 lbf.ft)
4-140	Lubricate thread with anti-seizing graphite grease (P189)	0,23 to 0,25 daN.m (1.69 to 1.84 lbf.ft)
4-160	Lubricate thread with anti-seizing graphite grease (P189)	0,7 to 0,8 daN.m (5.16 to 5.90 lbf.ft)

## STORAGE

### 1. Storage

#### A. Storage in the container

Storage in the container shall be of long duration more than 3 months).

No special packaging conditions are required. The container should be protected from the sun and bad weather.

#### B. Storage out of the container

- (1) Take the reheat duct out of the container (see para 2) and install it on the storage stand - tool SC 97 -
- (2) Store in areas where the relative humidity remains less than 60%.
- (3) Protect the parts with a non-hermetically sealed, anti-dust bag made of vinyl chloride.
- (4) Attach the document wallet to the equipment.
- (5) If the relative humidity is less than 60%, check the condition of the parts every 3 months. If above 60% check every month.

### 2. Removal of the reheat jet-pipe from the container (see Fig. 901)

#### A. Positionning on the storage stand

- (1) Remove the container lead seals and lift off the cover.
- (2) Install clamps - tool SC 7 - to the jet-pipe.
- (3) Remove the two upper half-bearings, which are retained by 2 bolts.
- (4) Lift the reheat jet-pipe from the container using lifting beam - tool SC 8 -
- (5) Lower the re-heat jet-pipe onto the storage stand - tool SC 97 -
- (6) Slacken the bolts locking the braces on the support beam, and remove the latter from the rear (see figure 902).
- (7) Remove the braces, and collapse the armature assemblies as follows (see figure 903):
  - (a) Unlock the locking system.

**78-11-01**

Page 904  
Dec 30/74

- (b) Free the segment retained by the "PIP" pin.
- (c) Collapse the assembly as shown in figure 903.

#### B. Returning empty containers

- (1) The container-to-contents connecting parts must be collected when the contents are removed from the container, and must be re-assembled in their respective locations in the container.
- (2) Re-assemble the support beam with the two brace and armature assemblies. Do not omit to fit the "PIP" pins and the locking system, which is essential in this case.
- (3) Mount this assembly in the container in the half bearings and retain it with the bolts.
- (4) Check, before closing container, that the coupling link has been removed from its box in the container. Also, check that the documents wallet has been removed from the external box.
- (5) Close and seal the container for return.
- (6) Obliterate the notices written on the black rectangle on the container.

### 3. Placing the equipment in the container

#### A. Preparation of the container

- (1) Place the container in the same area as the jet-pipe sufficiently in advance of the packaging operation for it to attain the same temperature as the re-heat jet-pipe, in order to avoid all risk of condensation.
- (2) Check the condition of the container (general cleanliness, lifting and handling rings, document box, closing devices, notices etc...).
- (3) Unlock the cover from the base and remove it with the appropriate tools.
- (4) Clean the joint faces and check the condition of the seal, flexible mountings, and internal fittings.
- (5) Disconnect the internal fittings from the container by removing the two upper half bearings.
- (6) Remove the fittings assembly from the container (paying attention to the pads on the armature assemblies).

78-11-01

Page 905  
Dec 30/74

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (7) Unlock the two armature assemblies from the support beam and braces.
- (8) Collapse the armature assemblies by slackening the locking systems and withdrawing "PIP" pins.
- (9) Wipe the internal walls of the container to remove all traces of humidity.

B. Preparation of the Reheat jet-pipe

- (1) Remove the coupling link (jet-pipe to spherical seal flange) and place it in the inner box of the container, wrapped up in quilted paper.
- (2) Ensure that the correct blank is fitted and locked to the inlet of the drain system (forward bowl).
- (3) Ensure the presence of the wallet containing the documents relevant to the parts packed.
- (4) Wipe the parts with clean, dry cloth.

C. Packing

- (1) With the reheat jet pipe placed horizontally on the storage stand SC 97 - place the first armature assembly inside the jet-pipe and against the anti-screech liner.
- (2) Bring the three segments of the armature assembly into contact with the inner wall of the jet-pipe and fix it with the "PIP" pin.
- (3) Operate the turn buckle to center the assembly. Apply a slight pre-load and lock the turn-buckle.
- (4) Do not lock the system (the locking system is only used for the return of the containers when empty).
- (5) Fit the second armature assembly, following the instructions above.

NOTE : Position it at 310 mm (12.2 in) from the rear flange of the reheat jet pipe.

- (6) Fix the first brace to the armature assembly placed against the anti-screech liner. Enter it via the front end of the reheat jet pipe.
- (7) Enter the support beam into the central boss of the first armature assembly, via the rear of the jet-pipe. Push the beam home until the stop fitted to the beam abuts against the central boss.

NOTE : The lifting lugs on the beam to be at the top.

78-11-01

Page 906  
Dec 30/74

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (8) Tighten the central boss with the bolt.
- (9) Enter the second brace assembly onto the beam via the rear of the jet-pipe, and fix it to the second armature assembly. Tighten the central boss onto the beam with the bolt.  
The internal fittings being thus in place in the re-heat jet-pipe.
- (10) Fit tool SC 7.
- (11) Lift the re-heat jet-pipe using - tool SC 8 - lifting beam.
- (12) Move the jet-pipe so assembled over the container.
- (13) Lower gently, so as not to bump the assembly, and rest it with the ends of the support beam on the two lower half-bearings.
- (14) Without removing the tooling, install the two upper half-bearings, locking washers and retaining bolts. Tighten the bolts.
- (15) Remove tooling SC 7 and SC 8.
- (16) Lock the bolts of each bearing together in pairs.
- (17) Lock the container :
  - (a) lower the cover onto the container base,
  - (b) secure the cover with clamps,
  - (c) lead-seal two opposite clamps.

INTRODUCTION

1. Purpose

This illustrated parts list gives a complete list of the components required for the overhaul of an equipment.

2. Illustrated parts list

The illustrated parts list is divided into three parts :

- Introduction
- Numerical index
- Detailed parts list

A. Numerical index :

For the sake of clearness, this repertory is divided into two parts :

- (1) Index of manufacturers references beginning with a letter.
- (2) Index of manufacturers references beginning with a figure.

These indexes include all the manufacturers references for the parts described in the detailed nomenclature in alphabetical or numerical order. Opposite each reference is given the chapter-section-subject-figure-item number and the quantity.

B. Detailed parts list.

The detailed parts list gives, in disassembly order, the list and illustrations of the parts making up the assembly concerned from the origin as shown in the example paragraph B6 effectivity.

- (1) Items index numbers.

To allow simple and speedy identification, each item is given a numerical item in 10 to 10 sequence, this item will not vary during the whole life of the item.

- (2) Original item.

To cater for systematic evolution due to modifications a "letter" variant is added to the numerical item. The letter variant "A" is given in the original document to identify all the items in original definition.

78-11-01

It is given in the text part only.

(3) Modified item (Item variant).

After each modification concerning an item, the numerical item of this item is maintained but the "letter" variant progresses systematically to "B", then "C", "D" etc. (letters I, O and X are not used). This variant evolution is shown in the text and on the drawings only in the case of a change. The use of the "letter" variant added to the numerical item has been made necessary to make possible the rational use of the "effectivity Code" (usage code) such as it is presented paragraph 6 of this foreword.

(4) Indent

The detailed nomenclature is presented indented showing the relation between the various items, i.e :

1 2 3 4 5 6 7

Assembly

Assembly component parts

Sub-assembly

Sub-assembly attachment parts

\* \* \*

Sub-assembly component parts

Sub sub-assembly

Sub sub-assembly attachment parts

\* \* \*

Sub sub-assembly component parts

(5) Quantity per assembly

The quantity indicated in the "Quantity per assembly" column is that required by the next higher assembly.

(6) Effectivity

A coded method is used to indicate parts effectivity.

This alphanumerical code indicates the installation possibilities of sub-assemblies and primary parts in relation to the next higher sub-assembly or assembly. The validity column is left blank when installation is possible in all cases.

78-11-01

OLYMPUS 593

MK.610-14-28  
OVERHAUL

This code corresponds to the next higher assembly or sub-assembly item.

Figure Item	Manufacturers Reference	Description							Effectivity
		1	2	3	4	5	6	7	
1A	123450	Assembly							
1B	123451	Assembly (SB 1)							
1C	123452	Assembly (SB 2)							
1D	123453	Assembly (SB 3)							
10A	234560	. PRIMARY PART							1A
10B	234561	. PRIMARY PART (BS 1)							1BAC
10C	234562	. PRIMARY PART (BS 3)							1D
20A	345670	. SUB-ASSEMBLY							1A
20B	345671	. SUB-ASSEMBLY (BS 1)							1BAC
20C	345672	. SUB-ASSEMBLY (BS 2)							
20D	345673	. SUB-ASSEMBLY (BS 3)							
		. ATTACHING PARTS							
30A	456780	. PRIMARY PART							
		* * *							
40A	567890	. . PRIMARY PART							20A
40B	567891	. . PRIMARY PART (BS 1)							20BA
40C	567892	. . PRIMARY PART (BS-2)							20CAB
40D	567893	. . PRIMARY PART (BS 3)							20D

The above example shows that :

- The primary part index 10A can only be installed in assembly indexed 1A.
- The primary part index 10B can be installed in assemblies indexed 1A, 1B, and 1C.
- The primary part index 10C can only be installed in assembly indexed 1D.
- The sub-assembly index 20A can only be installed in assembly indexed 1A.
- The sub-assembly index 20B can be installed in assemblies indexed 1A, 1B and 1C.
- The sub-assemblies indexes 20C and 20D and their attaching parts indexed 30A can be installed in all assemblies indexed 1 and thus do not have an "effectivity" code.
- The primary part index 40A can only be installed in sub-assembly indexed 20A.
- The primary part index 40B can be installed in sub-assemblies indexed 20A and 20B.

78-11-01

- The primary part index 40C can be installed in sub-assemblies indexed 20A, 20B and 20C.
- The primary part index 40D can only be installed in the sub-assembly indexed 20D.

(7) Figure Variant

When it is not possible to illustrate the different variants of an assembly, resulting from modifications to the basic figure, one or several supplementary illustrations will describe these variants.

These supplementary illustrations will bear the same number as that of the basic figure, followed by a letter taken in the alphabetical order (except I and O).

Whatever the number of figure variants, they will be covered by only one nomenclature.

To ascertain quickly on which figure variant the item variant is to be found, the figure variant letter will be indicated in the nomenclature, in the "index reference figure item immediately in front of the item number.

3. Using the illustrated nomenclature

The identification of a component is possible taking the following elements in consideration :

A. Through the manufacturer's reference.

Search for the manufacturer's reference in the numerical index, note the chapter-section-subject-figure-item number and refer to the corresponding nomenclature.

B. At sight of the component, without knowing its references.

Look for the figure showing the component among the illustrations this will indicate the item permitting reference to the detailed nomenclature.

## FOREWORD

### 1. Effectivity

Some procedures described in this manual such as assembly, repair procedures, etc... specifically relate to given types of equipment. Hence, effectivity reference numbers are used which relate equipment to procedures.

These effectivity reference numbers can take the form of either a manufacturer's reference number or a serial number.

The table drawn up below will enable you to make the association between the two sets of numbers.

Manufacturer's ref No.	Serial No.
301-217-000-0-	6001 to 6024
301-217-003-0-	6025 to 6027
301-217-003-0-	6028 - 6029
301-217-005-0-	6030
301-217-004-0-	6031 to 6082 etc.

DESCRIPTION - OPERATION

1. Description

The primary nozzle, is isostatically mounted by three pins inside the twin secondary nozzle, at the rear of the reheat duct.

The primary nozzle front flange is sensibly in the same plane as the inlet face of the twin secondary nozzle structure, and locates the rear flange of the reheat duct. (See Fig. 1).

The outlet plane lies in convergent section of the twin secondary nozzle.

The primary nozzle, made of austenitic alloy, basically comprises :

- the convergent section.
- the support ring assembly.
- the petals.
- the pneumatic jacks.
- the manifold unit and supply tubes.

A. The convergent section

Comprises a truncated cone section with a welded flange at each end.

The front flange locates the rear flange of the reheat duct.

On the rear flange of the convergent section, a fool-proofing peg, at  $10^\circ$  from the vertical centre line, ensures the correct position of the convergent section relative to the support ring assembly. The flange has 90 holes to accommodate bolts which secure the convergent section to the support ring, and also retain the petal hinge point yokes and double-yokes.

Two union bodies are rivetted to the convergent section, for fitting the pressure tapping tube (re-heat detection system).

The convergent guides the reheat duct gases to the petals.

B. Support ring assembly

This unit comprises a perforated drum, reinforced at the front end by a welded mounting ring section.

Relative Position of the Reheat Duct/Primary Nozzle/Secondary  
Nozzle Structure

OLYMPUS 593

MK.610-14-28  
OVERHAUL

The mounting ring section is a one-piece, austenitic steel forging, ECM machined, which :

- takes the loads which the 3 primary nozzle-to-twin secondary nozzle mounting pins transmit to it.
- includes the mounting points for the 18 pneumatic jacks and the air feed manifold.
- takes the loads which the handling ring imposes on it during manoeuvring of the support ring assembly (See Fig.2).

The mounting ring is protected internally from radiated heat by a three part rivetted heat shield. Each part of the heat shield is composed of quartz glass fiber sandwiched between two sheets of wafered stainless steel.

The support ring assembly accommodates the primary nozzle area detection system. It is mounted on a support assembly which is fixed, at one end, to a yoke fitted to the mounting ring, and, at the other end, to a twin yoke.

The primary nozzle area detection system is the subject of a special chapter 78-12-50.

#### C. The petals

The petals-in cast austenitic alloy-comprise two types :

- the actuated petals-hinged to 18 twin yokes fitted to the rear flange of the support ring assembly.
- the follower petals, which are fitted and "float" between the actuated petals.

#### D. Pneumatic jacks.

The 18 pneumatic jacks are of the tandem mounted double piston type (See Fig. 4).

They are connected to the PNC (Pneumatic Nozzle Control Unit) by 18 supply tubes and the manifold.

The body and the push rod of the jack are fitted with spherical bearing ends, which allow angular movement of the jack during operation. The jack body is thus fixed to the mounting ring by a pin, and the push-rod is attached to a lever by a threaded pin and nut.

Figure 4

78-12-01

Page 6  
Dec 30/74

The pneumatic jacks are subject of a special chapter 78-12-40.

## 2. Operation

The outlet area of the primary nozzle is varied by the simultaneous action of the 36 petals (18 actuated, 18 followers) moved by the 18 pneumatic jacks. It is controlled by the P.N.C. (Pneumatic Nozzle Control Unit) fixed in the nacelle.

The jacks only act in the nozzle closing direction. The petals are driven open by the gas stream pressure.

Figure 5 shows the linkage system to the petals. It can be seen that the control linkage itself ensures synchronisation of the movement of all the petals, since each jack is connected to two actuated petals and the movement is thus transmitted from one to the other.

DISASSEMBLY

1. General

- A. During dismantling, follow the recommendations given in chapter 70-05-00 of the manual of Standard Practices and in working procedures of the overhaul manual.
- B. Use only tools and other special equipment nominated in the dismantling procedures, and identified by a number SC... The tools are shown in the illustrated tools and equipment manual (I.T.E.M.).
- C. During dismantling, visually inspect all parts removed and report, to the inspection department, any defects found which could be obliterated by cleaning (scratches, burning etc.), and which may result from incorrect operation. Also report any broken parts or any locking devices not present.
- D. In the working procedures section of the manual, the parts are referenced to the IPC by two numbers in brackets, the first of which is the figure number in the IPC, the second being the item number within that figure

2. Disassembly of primary nozzle.

A. Placing on the work table - tool SC 59 -

- (1) Using the hoisting and swinging device - tool SC 24 - and the handling beam - tool SC 210 -, raise and remove the primary nozzle from the storage stand - tool SC 218 -.
- (2) Swing the primary nozzle and lower it on the work table - tool SC 59 - so as the convergent section front flange rests against the table.

B. Removal of the primary nozzle jacks (1-30)

- (1) Unlock and uncouple the supply tubes (1-10) from the jacks and the nozzle closing manifold - tool SC 35 -

ATTENTION : WHEN SLACKENING THE SUPPLY TUBE SERRATED NUTS, HOLD THE UNION BODIES ON THE JACKS AND THE MANIFOLD WITH A FLAT SPANNER.

- (2) Blank the supply tubes with storage plugs (1-20).
- (3) Remove the "U" shaped pin (1-40), washer (1-50) and pin (1-60).

78-12-01

Page 101  
Dec 15/75

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (4) Remove the jack (1-30) and fit the blanking plug.
- (5) Repeat operations (1), (2), (3), (4) and (5) for all 18 jacks.

NOTE : Retain the jack spherical bearings with brass wire.

C. Removal of pressure tube (1-100).

- (1) Cut the locking wire and slacken the pressure tube connecting nut.
- (2) Remove the self-locking nuts (1-110) and the 12 point head bolts (1-120).
- (3) Cut the locking wire and slacken the 12 point head nut (1-130).
- (4) Cut the locking wire and remove the 12 point head bolt (1-140) and clamp (1-150).
- (5) Removal of pressure tapping blanking.
  - (a) Cut the locking wire and unscrew the blank assembly (1-180).
  - (b) Unscrew the 12 point head bolt (1-190) and remove locking plate (1-200).

D. Disassembly of the nozzle area detection system

- (1) Remove the detection system protection - tool SC 33 -
- (2) Withdraw the pin (2-10) and remove grooved washer (2-20).
- (3) Withdraw the pin (2-30) and remove grooved washer (2-40) and pin (2-50).
- (4) Remove the link (2-60).
- (5) Removing the threaded end piece (2-70).
  - (a) Cut the locking wire and slacken hexagonal nut (2-80).
  - (b) Remove the threaded end piece (2-70) and hexagonal nut (2-80).
- (6) Remove the 12 point head bolt (2-100), the nozzle transducer (2-90) and protective plate (2-110).
- (7) Removal of support assembly (2-120).
  - (a) Remove spring (2-130).

78-12-01

Page 102

Dec 15/75

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Withdraw pin (2-140), remove grooved washer (2-150) and pin (2-160).
- (c) Withdraw pin (2-170), remove grooved washer (2-180) and pin (2-190).
- (8) Removal of connecting yoke (2-230).
  - (a) Withdraw pin (2-200), remove grooved washer (2-210) and pin (2-220).
- (9) Removal of the yoke (2-270).
  - (a) Unscrew the self-locking nuts, (2-240), remove flat washers (2-250) and 12 point head bolts (2-260).
- (10) Removal of the yoke (2-300)
  - (a) Unscrew the self-locking nuts (2-280) and remove hexagon head bolts (2-290).
- E. Dismantling of the actuating linkage and the petals.
  - (1) Removal of the follower petals (3-30)
    - (a) Cut the locking wire, unscrew the hexagon head bolts (3-10) and remove the stops (3-20).
    - (b) Repeat operation (a) for each of the 18 follower petals (3-30).
  - (2) Removal of detection system actuator links (3-100).
    - (a) Withdraw split pins (3-40), unscrew castellated nuts (3-50) and remove hexagon head bolts (3-60).
    - (b) Withdraw split pin (3-70), unscrew castellated nut (3-80) and remove hexagon head bolt (3-90).
    - \* (c) Repeat operations (a) and (b) for the other two links (3-100).
  - (3) Removal of petal actuating links (3-170)
    - (a) Withdraw split pins (3-110), unscrew castellated nuts (3-120) and remove pins (3-130) using extractor - tool SC 32 -
    - (b) Withdraw split pins (3-140), unscrew castellated nuts (3-150) and remove pins (3-160).

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (c) Dis-engage spherical bearings (3-180) and attach them to their respective links with brass wire.
- (4) Removal of actuated petals (3-220)
  - (a) Withdraw the "U" shaped pins (3-190), remove grooved washer (3-200) and pin (3-210).
  - (b) Remove lever (3-230).
  - \* (c) Repeat operations (a) and (b) for the second actuated petal (3-220).
- (5) Removal of actuated petals. (3-270)
  - (a) Withdraw the "U" shaped pins (3-240), remove grooved washers (3-250) and pins (3-260).
  - (b) Repeat operation (a) for each of the 17 petals (3-270).
- (6) Removal of levers (3-320)
  - (a) Withdraw split pin (3-280) unscrew castellated nut (3-290), remove flat washer (3-300) and pin (3-310).
  - (b) Repeat operation (a) for each of the 18 levers (3-320)
- F. Removal of the convergent section/support ring.
  - (1) Removal of the twin yokes (4-50).
    - (a) Unscrew self-locking nuts (4-10) and collect bolts (4-20)
    - (b) Unscrew self-locking nuts (4-30) and remove bolts (4-40)
    - (c) Repeat operations (a) and (b) for each of the 8 twin yokes (4-50).
  - (2) Removal of twin yokes (4-80)
    - (a) Unscrew self-locking nuts (4-60) and collect bolts (4-70).
    - (b) Repeat operation (a) for each of 10 twin yokes (4-80).
  - (3) Separating the support ring assembly, and convergent section
    - (a) Unscrew self-locking nuts (4-90) and collect bolts (4-100).
    - o (b) Set aside the stop (4-95)
  - (4) Separating the support ring from the convergent section

\* From primary nozzle No. 301-217-003-0

78-12-01

Page 104  
Dec 15/75

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (a) Fit the hoisting and swinging device - tool SC 24 - to the mounting ring section of the support ring assembly.
- (b) Using a hoist and lifting beam-tool SC 210 - lift the support ring assembly, invert it, and lower it, on the rear face of the mounting ring onto the build stand-tool SC 56 -
- (c) Remove handling equipment-tools SC 24 and SC 210 -
- (d) Remove the jointing segments (4-120) from the convergent section (4-110).
- (e) Use a hoist and lifting bar SC 66, place the convergent section on a pallet.

G. Disassembly of: support ring assembly (6-190)

- (1) Removal of the nozzle front fairing assembly (5-10)
  - (a) Unscrew 12 point head bolts (5-20) and remove bushes (5-30).
  - (b) Unscrew 12 point head bolts (5-40) and remove bush (5-50).
- (2) Removal of the nozzle closing manifold (5-90) and attachment parts.
  - (a) Unscrew the 12 point head bolts (5-60) and remove the manifold/supports assembly.
  - (b) Unlock and unscrew hexagon head bolts (5-70) and remove the support assemblies (5-80).
  - (c) Blank all 18 air outlets from the manifold with storage plugs (5-100).
  - (d) Unscrew connector plug (5-120) and remove blanking plug (5-130) - tool SC 31 -
  - (e) Blank the two air inlets to the manifold with storage plugs (5-110).
  - (f) Unscrew the 12 point head bolts (5-140) and remove the support assemblies (5-150).
- (3) Inversion of the support ring assembly.
  - (a) Fit the hoisting and swinging device - tool SC 24 - to the mounting ring section of the support ring assembly.
  - (b) With a hoist and lifting beam-tool SC 210 - lift the support ring assembly, turn it over,

78-12-01

OVERHAUL

and lower it - front face downwards - onto the build base - tool SC 56.

- (c) Remove the handling equipment - tools SC 24 and SC 210 -
- (4) Removal of the yokes (6-30)
  - (a) Unscrew self-locking nuts (6-10) and remove hexagon head bolts (6-20).
  - (b) Repeat operation (a) for each of the 18 yokes (6-30).
- (5) Removal of supports (6-60)
  - (a) Unscrew self-locking nuts (6-40) and remove hexagon head bolts (6-50).
  - (b) Repeat operation (a) for each of the 6 supports (6-60).
- (6) Removal of spherical bearing housings (6-110)
  - (a) Withdraw split pins (6-70) and unscrew castellated nuts (6-80).
  - (b) Remove the travel stop (6-90) and the spherical bearing/housing assembly.
  - (c) Dis-engage the spherical bearing (6-100) from its housing (6-110) by turning it through 90°.
  - NOTE : Attach the spherical bearing to its housing with brass wire.
  - (d) Remove bolts (6-130) and collect up "Truarc" rings (6-120).
  - (e) Repeat operations (a), (b), (c) and (d) for each of the 3 spherical bearing housings (6-110).
- (7) Removal of blanking covers (6-160).
  - (a) Withdraw split pins (6-140) and unscrew castellated nuts (6-150).
  - (b) Remove blanking cover (6-160).
  - (c) Remove bolts (6-180), and collect-up the "Truarc" rings (6-170)
  - (d) Repeat operations (a), (b) and (c) for each of the 3 blanking covers (6-160).

CLEANING

## 1. General

- A. At completion of disassembly, clean all the parts of the primary nozzle in order to remove all the surface contamination such as oils, greases, carbon deposits, corrosion and oxidation marks.
- B. The purpose of cleaning is to :
  - (1) Allow exhaustive visual inspection of parts.
  - (2) Disclose cracks due to operation through use of fluorescent penetrant inspection methods.
  - (3) Prepare the surfaces in view of future repair work.

## 2. Specific recommendations

- A. Any cleaning method selected by an operator shall comply with the following requirements to avoid penalization on the service life of parts.
  - (1) Do not degrease titanium parts, either welded or not using halogen products such as chlorinated solvents, trichlorethylene etc...
  - (2) Do not clean in acid solutions parts having complex shapes or featuring blind holes, i.e parts on which rinsing or neutralization processes are difficult to carry out thoroughly.
  - (3) Do not use cleaning agents the action of which may induce generalized or intergranular corrosion of materials, specially on those materials showing aging resulting from operation on engine.
- B. Limitations related to electro-platings, chemical surface treatments, paints, varnishes and hardface metal coatings.
  - (1) The cleaning methods recommended in this chapter are normally not harmful to the protective surface treatments applied on the primary nozzle constitutive parts.

**OLYMPUS 593**MK.610-14-28  
OVERHAUL

- (2) To avoid deterioration to surface treatments of parts or allow their future refurbishing, a list of the coated parts and their location identification (in regards of the Illustrated Parts List) is given hereunder.

(a) Silver coated parts nomenclature

# ATP TEMPORARY REVISION

## BRITISH AIRWAYS

OLYMPUS 593 OVERHAUL MANUAL  
EXHAUST SYSTEM PRIMARY NOZZLE

This Temporary Revision complies with BCAR's Chapter A6-2 and TSS No. 0-2.

for Chief Engineer (Technical & Quality Services) CAA Design Approval No.  
DA1/8566/78

### TEMPORARY REVISION 78-524

Insert in 78-12-01 facing page 301

#### REASON FOR ISSUE

To introduce a Refurbishment Specification to the Primary Nozzle Overhaul (MCR.EPO.452/MD).

#### ACTION

#### Concorde Exhaust System Refurbishment

##### Introduction

The exhaust system consists of four main components:-

- (a) The Reheat Jet Pipe
- (b) The Primary Nozzle
- (c) The Twin Secondary Nozzle
- (d) The Thrust Reverser Bucket

Their Refurbishment Specifications are as follows:-

Reheat Jet Pipe	CON 78.11.01.100 Issue 1
Primary Nozzle	CON 78.12.01.100 Issue 1
Twin Secondary Nozzle	CON 78.13.01.100 Issue 1
Thrust Reverser Bucket	CON 78.31.01.100 Issue 1

These refurbishment schedules fulfil the life development requirements of the Approved Maintenance Schedule (A.M.S.).

The work listed in the Refurbishment Schedule is to allow the unit to be considered as a "Condition Monitored" (C.M.) unit.

This means that such units are currently considered to have no known hidden "wear out" features that require planned time interval specific inspections. However, such units may be required to be stripped and inspected purely to gain experience of their condition, i.e. life samples when it is considered that opportunity arisings of strip and inspection are inadequate. Such life sampling requirements will be indicated by an A.M.S. revision.

##### Notes

Where the term "visual inspection" is used, it implies a visual inspection of all parts exposed arising either as a result of the minimum work content of the Refurbishment Schedule or to a greater depth of strip dictated by other reasons, i.e. repair of damage embodiment of modifications, etc.

When in the course of visual inspection evidence exists, e.g. wear witness, distortion, etc. that requires further stripping, it must be referred to Propulsion Engineering for a review of acceptance standards and agreement to further strip.

# BRITISH AIRWAYS

## OLYMPUS 593 OVERHAUL MANUAL EXHAUST SYSTEM PRIMARY NOZZLE

TEMPORARY REVISION No. 78-524 (Cont'd.)

### Concorde Exhaust System Refurbishment Primary Nozzle

Specification No. CON 78.12.01.100 Issue 1

1. The Primary Nozzle is to be disassembled IAW OHM 78-12-01 P/B 100.
2. At the completion of disassembly send the pneumatic jacks for overhaul IAW OHM 78-12-40.
3. Clean thoroughly all parts of the primary nozzle in order to remove all surface contamination such as oils, greases, carbon deposits, corrosion and oxidisation marks IAW OHM 78-12-01 P/B 200.
4. Crack detect parts listed in OHM 78-12-01 Page 304/5 using method listed. All parts failing to meet the required standard must be held for possible repair development.
5. Visually inspect all parts IAW OHM 78-12-01 P/B 300 and repair as required. Any part that is damaged beyond the repair limits must be held for possible repair development. Any part that is damaged and has no cleared repair scheme must be held for possible repair development.
6. Embody Modifications IAW the BA Modification call up list.
7. Inform Propulsion Engineering of any defects found during refurbishment.
8. Re-assemble the Primary Nozzle IAW OHM 78-12-01 P/B 500.
9. The Primary Nozzle inspection and release documentation is to state the specification number to which the unit has been refurbished.

sneema

## INSPECTION

### 1. Introduction

#### A. Inspection - General

(1) The "Estimate" inspection carried out on items removed from the accessory during overhaul aims at:

- eliminating worn-out or damaged items too expensive or impossible to be repaired.  
However, these items may be kept as the parts remaining sound may be used to repair an identical item,
- indicating the modifications to be applied to bring to a new standard,
- indicating the repairs to be carried out.  
If the case has not been foreseen, apply to the SNECMA repair office,
- eliminating parts having reached life limit.

#### B. Prepare for "Estimate" inspection

(1) Following disassembly clean each item according to the appropriate method defined in the "cleaning" section of the overhaul manual.

NOTE: Make sure that any assembly "awaiting inspection" be stored in "boxes" or containers provided for this purpose.

This inspection must be carried out on thoroughly clean parts.

Place all the parts making up the sub-assembly on the inspection tables covered with anti-shock material (Lino or similar material).

(2) Make a list of the modifications to be applied for each sub-assembly.

(3) Inspect the parts.

#### C. "Estimate" Inspection

CAUTION: DURING INSPECTION OPERATIONS THE PARTS MUST BE HANDLED WITH THE GREATEST CARE TO AVOID BLOWS, SCRATCHES, ETC...

**78-12-01**

Page 301  
Dec 30/74

- (1) Personnel carrying out this inspection must have a thorough knowledge of the instructions given in Inspection and Repair sections of this manual and in the corresponding chapter 70.  
It must be conscious of the importance of its decisions and of their consequences. A good technical and functional knowledge of the accessory will enable this personnel to carry out an efficient and intelligent inspection, particularly in vital zones.
- (2) The inspection methods to be used are the following:
  - Visual inspection.
  - Inspection for soundness.
  - Dimensional inspection.

NOTE: These inspections are best carried out in the order given so that faulty, not repairable parts detected during visual or soundness inspection may be discarded before the geometrical inspection is undertaken.

Should new defects be detected the repairer will request the study of a repair scheme from SNECMA.

- (3) During inspection each part will be labelled (see chapter 70-10-00) so as to indicate:
  - if it is fit for putting back in service,
  - if it requires repair,
  - if it must be replaced.

The labelling of parts can be used to record dimensions that may affect a play or a tolerance. This record will enable inspection to check the play or tolerance on final assembly.

#### D. Protection against corrosion following inspection

- (1) After inspection, when 3 months elapses before re-assembly, apply a temporary protection to carbon steel, alloy steel and martensitic alloy parts using a dehydrating oil such as Ensis Fluid 254 (P309) or ARDROX 396/1E8 (P373) or RUSTILO DW377 (P373).

## 2. Visual inspection

- A. Visual inspection is an operation which starts on reception of the accessory (inventory) and continues during disassembly, on table inspections, re-assembly, testing and dispatching.

OLYMPUS 598

MK.610-14-28

OVERHAUL

(1) Visual inspection generally concerns the following points :

- each part is examined to ascertain its general condition and make sure it is fit for service. Refer to chapter 70-21-00.
- parts featuring sheet metal elements must be devoid of nicks, metal rips, heavy distortion and/or, burning marks.
- threads and tapped holes must not be damaged.
- hinged parts (such as, pin/bush bores, link rod spherical joint inner/outer liners...) must be free from seizing or scratching indications ; if not, remove defects using fine emery cloth.
- parts featuring areas with hard-face protection must not show flaking.
- rivets securing various elements on riveted assemblies, must not be loosened, rotating, or missing, otherwise change rivets.
- self-locking nuts, must have a satisfactory locking torque. Refer to chapter 70-21-00 ; otherwise, renew nuts.
- crimped self-locking nuts must have satisfactory locking torque. Refer to chapter 70-21-00 ; otherwise, renew nuts.

(2) Steps to be taken, with regard to damages found on parts, are given in paragraph 5, "Inspection of parts".

### 3. Inspection for soundness

A. The main purpose of the inspection for soundness is to ascertain that the accessory parts are not cracked.  
The inspection methods used are the following :

- Visual inspection
- Dye penetrant inspection - refer to chapter 70-20-10
  - M 502 B - Water washable fluorescent penetrant inspection (except for titanium parts)
    - P - penetrant spraying
    - T - immersion in penetrant
  - M 504 B - Post-emulsified fluorescent penetrant inspection (except for titanium parts).

#### 4. Dimensional inspection

##### A. General

##### (1) Measuring instruments

The selection of any measuring instrument is to be made in relation to the precision desired.

##### (a) Instrument classification

Two kinds of measuring instruments are to be distinguished :

- standard and universal measuring instruments such as : slide gages, micrometers, depth gages, dial indicators of various types, miscellaneous gages, etc...

This equipment is part of the provisioning items that are procurable in the trade and require no particular comment provided that they are available in the required quantity and precision, and satisfy to the requirements for the work to be undertaken.

**78-12-01**

Page 305

Dec 30/74

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- special inspection equipment such as :  
bases, supports, rigs, jigs, etc...

These tools are identified by a type number in the manual text at the exact place where they are used.

(b) Calibration

Measuring instruments used in overhaul are to be checked periodically according to a procedure defined in relation to master instruments (SNECMA to be informed of procedure), themselves checked in relation to the official master instruments of the country concerned.

The Official Control Authorities of the countries where repairs are carried out will have to take steps to ensure that the repairer has set up suitable facilities and equipment.

In the absence of a procedure in the countries concerned the repairer will request from SNECMA the procedure applied in their own workshop.

B. Dimensional inspection of parts

Details concerning the dimensional inspection and the acceptance criteria are given in paragraph 5 "Parts Inspection".

5. Inspection of parts

A. Air supply tube (1-10)

(1) Visual inspection

- (a) Damage affecting thread or desilvering of one or both the tube end nuts is cause for repair in accordance with BOR 35 re-silver plating end nuts.
- (b) The spherical contact surface of the tube nozzle must be free from scratches or flat defects ; if not, scrap the tube.
- (c) The tube external surface must be devoid of chafing indications and/or, scratches.

Otherwise :

- . using fine emery cloth, remove defects if depth is less than 0,10 mm (0.004 in).

78-12-01

Page 306

OLYMPUS 593

MK.610-14-28

OVERHAUL

. scrap the tube if defects are deeper than  
0,10 mm (0.004 in).

(2) Inspection for soundness

Cracks affecting weld beads, are to be removed by filler welding, as per REP 1-10-1.

B. Tube (1-100)

(1) Visual inspection

(a) Thread deterioration or desilvering affecting the tube nipple or the union nut is cause for renewal of the damaged element, as per REP 1-100-2.

(b) The spherical contact surface of the tube nozzle must not show scratches or flat defects ; if not, renew nozzle, as per REP 1-100-2.

(c) The tube external surface must not show chafing or scratch indications ; if that's not the case :

using fine emery cloth, remove defects if they are less than 0,10 mm (0.004 in) in depth.

renew segment of tube affected, if defects are deeper than 0,10 mm (0.004 in) as per REP 1-100-2.

(2) Inspection for soundness

Cracks affecting the weld beads must be removed by filler welding, as per REP 1-100-1.

C. Blanking part assembly (1-180)

(1) Visual inspection

(a) Thread deterioration or desilvering affecting nut of union, is cause for scrapping of the blanking part.

(b) The spherical contact surface of the nozzle must not show scratches or flat defects, otherwise, scrap the blanking part.

(2) Inspection for soundness

Cracks located in the sleeve/nozzle welded joint must be repaired by filler welding, as per REP 1-180-1.

78-12-01

Page 307  
Dec 15/75

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

D. Link (2-60)

(1) Dimensional inspection

- (a) Inner diameter wear of bushes located in the threaded end-pieces of link is acceptable if diameter size is less than or equal to 6,05 mm (0.2382 in).

Beyond this limit, renew the threaded end-piece bushes, as per REP 2-60-1.

E. Support assembly (2-120)

(1) Dimensional inspection

- (a) Wear condition of the eyelet bores is acceptable if bore size is less than or equal to 6,05 mm (0.2382 in).

Beyond this value, resize by inserting a bush.

F. Connecting yoke (2-230)

(1) Dimensional inspection

Wear of holes is acceptable if their respective diameter is less than or equal to 6,05 mm (0.2382 in).

Beyond this limit, scrap the connecting yoke.

G. Yoke (2-270)

(1) Dimensional inspection

Wear of holes accommodating the hinge pin is acceptable if their diameter is less than or equal to 6,05 mm (0.2382 in).

Beyond this limit scrap yoke.

H. Yoke (2-300)

(1) Dimensional inspection

Wear of holes accommodating the hinge pin is acceptable if their diameter is less than or equal to 6,05 mm (0.2382 in).

Beyond this limit scrap yoke.

I. Stop (3-20)

(1) Visual inspection

78-12-01

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (a) Thread deterioration of tapped hole is cause for scrapping of the part.
- (b) Peening marks on the stop lateral faces are acceptable if their depth is less than 0,3 mm (0.012 in).

Repair scheme awaiting release.

J. Follower petal (3-30)

(1) Visual inspection

- (a) Broken condition of one or both positioning lugs is cause for scrapping of the petal.

(2) Inspection for soundness

(a) Cracks affecting the center rib :

- . which are less than or equal to 2 mm (0.079 in) in length and which do not reach the petal base plate are to be removed using a grinding wheel as per REP 3-30-2.
- . which are longer than 2 mm (0.079 in) or progressing in the petal base plate, are cause for scrapping of the part.

- (b) Cracks affecting the front positioning lugs must be removed through filler welding.

- (c) Minute cracks emanating from lateral edges are acceptable.

(3) Dimensional inspection

- (a) Twisted condition of the petal, measured at lateral faces is acceptable if less than or equal to 1 mm (0.039 in).

Beyond this limit, re-shape petal as per REP 3-30-1

- (b) Bending of the lateral edges is acceptable if resulting sag does not exceed 1 mm (0.039 in).

Beyond this limit, re-shape petal as per REP 3-30-1

- (c) Twisting of the stop mounting pad is acceptable if it does not exceed 4° in relation to theoretical position of the mounting pad.

Beyond this limit, un-twist the mounting pad as per REP 3-30-1.

78-12-01

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (d) Defect in flatness of the mounting pad top surface is acceptable provided that the flatness error is less than 0,7 mm (0.028 in).

Beyond this limit, re-shape the petal as per REP 3-30-1

- (e) A defect in orientation of the front positioning lugs is acceptable if less than 1 mm (0.039 in) from nominal position.

Beyond this limit, re-shape the petal as per REP 3-30-1

K. Link (3-100)

(1) Dimensional inspection

- (a) Buckling of the link is acceptable if sag is less than 2 mm (0.079 in).

Beyond this limit, re-shape link as per REP 3-100-1.

- (b) Wear of holes is acceptable provided that hole dia. is less than or equal to 5,1 mm (0.201 in).

Beyond this limit, scrap the link.

L. Link (3-170)

(1) Dimensional inspection

- (a) Buckling of the link body is acceptable provided that sag is less than 0,3 mm (0.012 in).

Beyond this tolerance, re-shape the link as per REP 3-170-1.

- (b) Wear condition of the spherical bores is admissible if bore diameter is less than or equal to 18,2 mm (0.716 in).

Beyond this tolerance, scrap the link.

M. Spherical joint (3-180)

(1) Dimensional inspection

Wear condition of the spherical outer dia. is admissible if dia. is higher than or equal to 17,9 mm (0.705 in).

Under this value, scrap the spherical joint.

78-12-01

OLYMPUS 593

MK.610-14-28

OVERHAUL

N. Actuated petal (3-220,270)

(1) Visual inspection

- (a) Failure of the lateral "ears" accommodating the stops (3-20), entails repairing the petal by filler welding as per REP 3-220-4.
- (b) Heavy distortion of the petal front guide tabs is unacceptable :
  - if tabs are distorted but not cracked, perform re-shaping as per REP 3-220-1.
  - if tabs are cracked or broken, scrap the petal.

(2) Inspection for soundness

- (a) Cracks affecting the petal ribs :
  - . are to be removed by grinding if less than 2 mm (0.079 in) as per REP 3-220-2.
  - . entail scrapping the petal if longer than 2 mm (0.079 in).
- (b) Cracks located in recesses of the lateral "ears" accommodating stops (3-20) shall be repaired by filler welding as per REP 3-220-3.
- (c) Cracks originating from the petal lateral edges :
  - . which do not progress through the petal base plate shall be filler welded as per REP 3-220-3
  - . which progress in the petal base plate are cause for scrapping of the part.

(3) Dimensional inspection

- (a) Bending of the petal lateral edges is acceptable if less than or equal to 1 mm (0.039 in), measured throughout the petal length.  
A local distortion is acceptable if less than or equal to 0,3 mm (0.012 in).  
Beyond this tolerance, perform re-shaping of petal as per REP 3-220-1.
- (b) Chafing wear affecting recesses of lateral "ears" accommodating the stops (3-20) is acceptable if recess width is less than or equal to 15 mm (0.591 in).

OVERHAUL MANUAL

ATP: E6868

TEMPORARY REVISION No. 78-534

THIS TEMPORARY REVISION IS ISSUED BY BRITISH AIRWAYS ENGINEERING (TECHNICAL INFORMATION SERVICES, G2, TBA, S401, P. O. BOX 10, HEATHROW AIRPORT, HOUNSLOW, MIDDLESEX TW6 2JA) AND COMPLIES WITH BCAR'S CHAPTER A5-3, B5-3 AND/OR TSS No. 0-2 AS REQUIRED. CAA DESIGN APPROVAL No. DAI/8566/78.

For CHIEF ENGINEER QUALITY AND TRAINING

Manual Reference 78-12-01 Page 312

**REASON FOR REVISION**

British Airways information (BA Page 312) re-issued to align with manufacturers Revision No. 23.

**ACTION**

Paragraph 5. Inspection of parts

Add new Sub-Paragraph QA as follows:

QA. Stop plate (4-95A)

Repair small cracks in accordance with BOR 4, use welding fixture to ensure hole pitch is maintained during welding.

Originator: TIS  
Reference: -  
Workbook: GE 78-51

78-12-01  
Page 312

**OLYMPUS 593**  
**MK. 610-14-28**  
**OVERHAUL**

Beyond this limit, repair petal by filler welding as per REP 3-220-4.

**O. Lever (3-230)**

**(1) Dimensional inspection**

- (a) Buckling of the lever body is acceptable if sag is less than 1 mm (0.039 in).

Beyond this tolerance, perform lever re-shaping as per REP 3-230-1.

- (b) Wear of bores is acceptable if bore size is less than or equal to:

- 10,2 mm (0.402 in) for the "lever hinge" bore
- 5,1 mm (0,201 in) for the "link 3-100" bore
- 6,2 mm (0.244 in) for the "link 2-60" bore

Beyond these limits, scrap the lever.

**P. Lever (3-320)**

**(1) Dimensional inspection**

Wear of bores accomodating the lever/yoke 6-30 hinge pin, is acceptable if bore sizes are less than or equal to 12,1 mm (0.476 in). Beyond this limit, rework lever by bush insertion in accordance with REP 3-320-1.

**Q. Twin yoke (4-50, 80)**

**(1) Dimensional inspection**

Wear of bores is admissible if bore size is less than or equal to 10,05 mm (0.39567 in).

Beyond this limit, repair as per REP 4-50-1.

**R. Convergent section (4-110)**

- (a) Acceptance criteria for damage affecting the shape of the convergent central section are the following :

**78-12-01**

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- 1 Wrinkles in the central section metal unacceptable.
- 2 Collapsed sheet metal just in front of the rear flange is acceptable provided that measured sag is less than 2 mm (0.08 in).

In case of unacceptable damage, repair the central section by patch welding per REP 4-110-3.

- (b) Deterioration of union threads of pressure tappings implies renewal of the unions as per REP 4-110-4.
- (c) A loosening of the dowel pin on the convergent sections variant "A" is unacceptable.

Renew it in accordance with REP 4-110A-5.

- (d) Wear marks on front flange are acceptable after smoothening the surface, providing that the geometrical conditions hereafter defined are complied with.
- (e) Impact marks on the central section are admissible so long as they are localized dents without cracks or sharps edged bottoms. If they fail to meet these requirements, the central section is to be repaired by welding a patch on in accordance with REP 4-110-3.

(2) Inspection for soundness

- (a) Cracks spreading in welded seams of flanges, liners, pads, shall be removed by filler welding as per REP 4-110-2.
- (b) Cracks emanating from a weld bead and progressing in the sheet metal must be filler welded as per REP 4-110-2 or if they feature ramifications or affect a burned area, they are to be removed through patch installation as per REP 4-110-3.
- (c) Cracks arising near the retaining bolt holes on rear flange are not acceptable.

If cracked, the flange is to be replaced.

78-12-01

Page 313  
Mar 31/78

OLYMPUS 593

MK.610-14-28  
OVERHAUL

(3) Dimensional inspection

- (a) An increase in the front flange average inner diameter, as measured in planes P1, P2, P3, at 20°C room temperature is :

- 1 acceptable if average dia. is less than or equal to 1020,1 mm (40.161 in)
- 2 unacceptable if average dia. is larger than 1020,1 mm (40.161 in), and requires resizing of flange by metallization in accordance with REP 4-110-6.

CAUTION - A 10°C VARIATION IN ROOM TEMPERATURE RESULTS IN A 0,13 mm (0.00512 in) LINEAR CHANGE OF THE FLANGE INNER DIA

Inspection method (refer to figure 301)

The front flange inner average diameter, measured in plane P1, then in plane P2, and then in plane P3, is determined by computing the arithmetical mean of 18 measurements taken in the appropriate plane.

To perform these measurements, proceed as follows :

- 1 On the flange inner wall (I.D) index mark 18 generatrices equally spaced on the front flange half-circumference.

CAUTION : UNDER NO CIRCUMSTANCES SHALL THE TRACING OF THE INDEX MARKS BE DETRIMENTAL TO SURFACE CONDITION OF THE FLANGE INNER WALL ( OR INNER DIA.).

- 2 Using the stiffening tool SC 118, remove the front flange out-of-round.
- 3 Calibrate the gauge TESA UNIMASTER - TESA S.A. 1020 RENENS - V/D/Switzerland - Agent for France : SYNERGIE, 27, Av Philippe Auguste - PARIS 11ème - Tel. 357.21.00.
- 4 Fit the measuring gauge with :
  - a the necessary tube extensions to obtain the dimension to be checked,

**REASON FOR REVISION**

British Airways information (BA Page 315) re-issued to align with manufacturers Revision No.22.

**ACTION**

Reference Para 5.S. Jointing segment (4-120)

Add to Sub Para (1) (b) the following:

Small cracks may be welded in accordance with BOR 34.

OLYMPUS 593

MK.610-14-28

OVERHAUL

b the supports, properly adjusted, to establish measuring plane (P1,P2,P3).

5 Rest the gauge supports on the front flange rim and measure.

6 Repeat the same operation in line with the 18 index marks.

S. Jointing segment (4-120)

(1) Visual inspection

(a) Local distortions of the flanged edge shall be removed through segment re-shaping, as per REP 4-120-1.

(b) Flanged edge wear is acceptable if not associated with puncturing.

Otherwise, scrap the segment.

(2) Soundness inspection

(a) Cracks starting from the edge of the part, evolving in the sheet metal, shall be built-up in accordance with REP 4-120-2 if there is a minimum space of 3 mm (0.12 in.) between each crack and if they are not located in a burnt area.

T. Nozzle front fairing (5-10)

(1) Visual inspection

(a) A local distortion of the sheet metal is acceptable if not associated with cracking or burning ; otherwise, repair the fairing by fitting a riveted patch, in accordance with REP 5-10-2.

(b) Tears in the sheet metal are unacceptable and shall be repaired by riveted patches, in accordance with REP 5-10-2.

(c) Worn condition of the fairing eyelets if less than 0,3 mm (0.012 in) in depth, is acceptable after smoothing out wear marks.

Beyond this limit, renew the eyelets as per REP 5-10-2.

OVERHAUL

sneema

- (d) Signs of wear on the upstream and downstream stiffeners are acceptable unless compounded by cracks and or punctures. If so, replace the damage items in accordance with REP 5-10-3.

(2) Soundness inspection

- (a) Cracks occurring in the fairing metalsheet are to be repaired as follow :
  - 1) By weld filling in accordance with REP 5-10-1 if isolated and lying in an unoxidized area.
  - 2) By patching in accordance with REP 5-10-2, if ramified or lying in an oxidized area.
- (b) Cracks arisen in the different weld parts stiffeners, grommets, etc... require the item affected to be replaced in accordance with REP 5-10-3.

U. Nozzle closing manifold (5-90)

(1) Visual inspection

- (a) Surface deterioration affecting the manifold (chafing indications, scratches), are to be removed using fine emery cloth if damage depth less than 0,15 mm (0.006 in.);

Beyond this limit, renew the damaged manifold segment in accordance with REP 5-90-2.

- (b) Thread deterioration affecting the manifold unions, or the tapped holes of the manifold clamps, results in renewal of the damaged manifold component.

- (c) Dent on air manifold tube is acceptable if there is no cracks or sharp edges..

If not, renew the damaged manifold segment in accordance with REP 5-90-2.

V. Spherical joint (6-100)

(1) Dimensional inspection.

78-12-01

OLYMPUS 593

MK. 610-14-28

OVERHAUL

sneema

- (a) Worn condition of the spherical diameter is acceptable if dia. is less than or equal to 49,90 mm (1.96456 in.).

under this value, scrap the spherical joint.

(2) Inspection for soundness:

- (a) Cracks localised in welded beads jointing each other the various elements are to be removed by filler welding in accordance with REP 5-90-1.
- (b) Worn condition of the joint bore is acceptable provided that bore size is less than or equal to 32,05 mm (1.26180 in.).

Above this limit, scrap the spherical joint.

W. Spherical joint box (6-110)

(1) Dimensional inspection

- (a) Worn condition of the spherical inner diameter is acceptable if dia. is less than or equal to 50,50 mm (1.97046 in.).

Above this value, scrap box.

- (b) A defect in flatness of the spherical joint box mounting flange is acceptable if less than 0,5 mm (0.020 in.).

Above this tolerance, perform flange re-shaping in accordance with 6-110-1.

X. Support ring assy (6-190)

(1) Visual inspection

- (a) In the wafered sheet of the thermal insulation liner, damages resulting from an overtemperature or tears are unacceptable.

Depending on how heavy is the deterioration, repair of the wafered heet is accomplished by patch installation or renewal of the damaged sheet segment as per REP 6-190-3 or 6-190-2.

- (b) Desilvering condition or thread deterioration of pads

78-12-01

OLYMPUS 593

MK. 610-14-28

OVERHAUL

sneema

and riveted nuts entail the renewal of the damaged part, in accordance with REP 6-190-2.

- (c) A dislodged locating pin on the support ring assy model C, is unacceptable. Replace the pin in accordance with REP 6-190C-4.
- (d) Signs of wear on the rear flange, due to knocking by the petal seal segments, are admissible after smoothing over the surface, if they are not deeper than 0,8 mm (0.031 in.). Above this limit, lay the part by pending an appropriate repair scheme.
- (e) Signs of wear on the front flange, due to interference with the front nozzle fairing, are admissible after smoothing over the surface, if they are not deeper than 0,5 mm (0.020 in.). Above this limit, lay the part by pending an appropriate repair scheme.

## (2) Soundness inspection

- (a) Cracks in weld beads are to be removed by weld filling as per REP 6-190-1.
- (b) Cracks in the wafered sheet of the terminal insulation liner are to be repaired by patching as per REP 6-190-3.
- (c) Cracks in the ring sheet metal are to be repaired as follows:
  - 1) By weld filling, as per REP 6-190-1, if isolated and lying in an unoxidized area.
  - 2) By patching in accordance with REP 6-190-5, if ramified or lying in an oxidized area.

## (3) Dimensional inspection

- (a) Worn condition of the (support ring) bush bores accomodating the primary nozzle jacks attachment pins, is acceptable if the bore size does not exceed 10,1 mm (0.398 in.).

Above this dimension, recondition the support ring by installing oversized bushes, in accordance with REP 6-190-6.

78-12-01

**OLYMPUS 593****MK. 610-14-28****OVERHAUL****sneema**

- (b) Worn condition on the FWD face of rear flange is acceptable if the remaining thickness is more than 5,4 mm (0.216 in.).

under this value, lay the part by pending an appropriate repair scheme.

Y. Pins.

(1) Dimensional inspection.

- (a) Diametrical wear affecting these pins is acceptable if their respective outer dia. is larger or equal to minimum dimensions specified in the following table.

Scrap any pin under minimum dia. specified.

Pins	Minimum acceptable diameter
1-60	9,90 mm (0.38976 in.)
1-90	9,90 mm (0.38976 in.)
2-50	5,90 mm (0.23228 in.)
2-190	5,90 mm (0.23228 in.)
2-220	5,90 mm (0.23228 in.)
2-250	5,90 mm (0.23228 in.)
3-60	4,70 mm (0.18504 in.)
3-90	4,70 mm (0.18504 in.)
3-130	9,90 mm (0.38976 in.)
3-160	9,90 mm (0.38976 in.)
3-210	9,95 mm (0.39173 in.)
3-260	9,95 mm (0.39173 in.)
3-310	11,90 mm (0.46850 in.)

## REPAIR

### 1. Format of the repair schemes

Each repair scheme (REP) describes only one operation to be carried out on a single part.

#### A. Repair scheme identification and classification

Any one part is identified by :

- its nomenclature
- its classification in the Illustrated Parts List (Figure-Item)

A repair scheme is identified by :

- the part to which it relates
- the purpose of this repair

These various criteria have been used for identification and classification purposes.

##### (1) Identification

The identification of a repair scheme is given by :

- the nomenclature of the part with its IPL reference No. (Figure-Item)
- the purpose of the repair preceded by its numerical order

##### (2) Classification

The classification of a repair scheme is given by :

- the A.T.A. breakdown system
- the number of the repair scheme which is given by :
  - (a) The part IPL classification (Figure-Item) and the repair numerical order.
- the page number, proper to any repair scheme (re-starts from page 401 for each repair scheme)
- the date

##### (3) Sample of identification and classification

78-12-01

FOREWORD  
Page 401

OLYMPUS 593

MK.610-14-28  
OVERHAUL

NOTE : The REP numbering system uses the repair scheme identification criteria in order to establish the direct identification/classification relationship.

(4) Particular case

(a) Identical parts

When n identical parts are installed on a same assembly, the numbering of the REP will be made by using the IPL classification of the first part.

Example :

Identification of the  
thrust reverser cascades : CASCADE (2-10, 11, 30, 31,  
50, 51, 70, 90, 110, 111,  
130, 150, 170, 190)

REP No. : REP. 2-10-1

(b) Optional parts

In the case of the I.P.L. making mention of optional parts (OPT TO ...) and should these parts require a special repair scheme, the said scheme shall be identified as follows :

- the nomenclature of the part with its IPL reference No. (Figure - Item) of the basic part (and, if required, the manufacturer's part number),
- the purpose of the repair preceded by its numerical order number,  
and classified as follows :
- A.T.A. breakdown system,
- the number of the repair scheme which is given by the IPL classification of the basic part (Figure - Item) and the repair scheme numerical order number followed by an alphabetical variant,
- page numbered 401 and onward,
- the date.

## 2. Updating

A. The revisions, entailed by the technical evolution of the repair scheme, will affect its classification only as far as the date is concerned.

B. Modification of the alternate part

An alpha variant is introduced in the IPL and modifies the figure-item No.

- (1) This modification has no effect on the repair scheme :  
- the REP remains unchanged
- (2) This modification introduces a new REP :

Elaboration of a new repair scheme in which appears the alpha variant issue letter introducing this new REP.

Example : The modification introduces a REP with issue letter C, the previous REP is valid for the parts A and B.

REP 4-20-3 : valid for alpha variant A and B

REP 4-20C-3: valid from alpha variant C.

REPAIR

AIR SUPPLY TUBE (1-10).

1. Crack filler welding.

---

PARTS REQUIRED FOR REPAIR

---

Filler welding wire P 3009

---

A. Filler welding of cracks.

Filler weld cracks according to instructions given in chapter 70-35-10.

- Filler welding wire P 3009
- Weld class B 3.

B. Weld inspection.

- (1) Inspect welds, class B3, according to instructions given in chapter 70-35-80.
  - Water washable fluorescent penetrant inspect as per process M 502 B, chapter 70-20-10.
  - X-ray inspect as per chapter 70-20-30.

- (2) Perform a pressure test with fluid (P 163).

Test pressure : 50 bar (725 psi).  
Pressure holding time : 5 minutes.

C. Cleaning.

- (1) Degrease the supply tube in trichlorethylene vapours as per process M 101 A, chapter 70-15-20.
- (2) Run clean trichlorethylene (P 76) through the supply tube, at room ambient temperature, for 5 minutes.
- (3) Rinse the tube with running hot water (85 to 90°C).
- (4) Dry tube by insufflating dehydrated air.

REPAIR

TUBE (1-100)

1. Crack filler welding.

---

PARTS REQUIRED FOR REPAIR

---

Filler welding wire P 3028.

---

A. Filler welding of cracks.

Filler weld cracks according to the instructions detailed in chapter 70-35-10.

- filler welding wire P 3028
- weld class B3.

B. Weld inspection.

(1) Inspect welds, class B3, according to the instructions given in chapter 70-35-80.

- water washable fluorescent penetrant inspect as per process M 502 B, chapter 70-20-10.
- X-ray inspect as per chapter 70-20-30.

C. Heat treatment.

(1) Carry out a tube annealing heat treatment as per instructions detailed in chapter 70-45-00.

- heat treat at : 800°C
- maintain at this temperature level for : 8 hrs.

D. Pressure test.

Perform a pressure test using fluid (P 163).

- test pressure : 50 bar (725 psi).
- pressure holding time : 5 minutes.

REPAIRTUBE (1-100)2. Renewal of a segment of tube

---

**PARTS REQUIRED FOR REPAIR**

---

Elbow	No. 301-226-700-0
Union	No. 301-226-801-0
Union nut	No. 649-794-100-0
Nozzle	No. 649-794-112-0
Liner	No. 301-226-300-0
Tube	No. 301-227-100-0
Pre-shaped tube	No. 301-227-203-0
Tube P 3420, outer dia 6,35 (0.250 in), wall thickness 0.8 mm (0.031 in).	
Welding filler wire P 3028	
Brazing filler metal P 3152	

---

## A. Requirement related to the installation of a tube segment.

- (1) The cut-out of a deteriorated segment of tube is to be accomplished so that minimum distance separating two weld beads is 10 mm (0.394 in).

## B. Preparation of a tube segment.

- (1) Tube segment to be installed should be machined out from :
- a scrapped tube
  - a new pre-shaped tube
  - a tube P 3420, dia 6,35 (0.250 in), wall thickness 0,8 mm (0.031 in), for straight tube sections.

## C. Installation of tube segment.

- (1) Machine (fit) the segment of tube to be welded on tube (1-100) in compliance with dimensional requirements shown on figure 401.

NOTE 1 - When fitting the segment, allow for the important metal shrinkage (0,5 mm-0.020 in approx.) which will occur during welding operation.

NOTE 2 : If tube segments used for repair feature details to be brazed, those details must be fitted on tube segment so as to obtain a play within 0,04 and 0,12 mm (0.0016 - 0.0047 in).

- (2) Tack weld and argon arc weld the tube segment in accordance with instructions detailed in chapter 70-35-10.

- in filler welding wire P 3028
- weld class B3.

NOTE : If tube segment used for repair features details to be brazed, those details shall be installed on tube segment, before welding the latter.

- (3) Inspect welds, class B3, as per instructions detailed in chapter 70-35-80.

- water washable fluorescent penetrant inspect per process M 502 B, chapter 70-20-10.
- X-ray inspect per chapter 70-20-30.

D. Brazing of the various elements (if applicable).

- (1) Locate in place the tube, and/or, the liner and induction braze them using an high-frequency generator, as per instructions detailed in chapter 70-40-10.

- brazing filler metal P 3152.
- brazing class B1.

- (2) Inspect brazed joints, class B1, as per instructions detailed in chapter 70-40-80.

E. Heat treatment.

- (1) Carry out annealing heat treatment of tube as detailed in chapter 70-45-00.

- Heat treatment temp. : 800°C.
- Maintain at this temp. level for : 8 hrs.

---

A. Removal of the existing bushings.

(1) Machine out bushing or bushings not within limits.

B. Checking the bores which accommodate the bushings.

(1) Check that bore diameters are within limits prescribed in Table I.

1st case - the diameter is within limits : select bushing to be installed.

2nd case - the diameter is not within limits : bore resizing is necessary.

C. Eventual rework of bores accommodating the bushings.

(1) When bore diameter is out of limits, rework it so as to obtain the nearest oversize dimension prescribed in Table I.

D. Bushing installation

(1) Select (match) the bushings to be installed, according to the accommodating bore diameters, and in compliance with dimensional requirements of Table I.

(2) Fit the bushings after having them shrunk in liquid nitrogen (P 441).

E. Dimensional inspection

(1) Check the link bores center-to-center dimension as shown on figure 401.

## REPAIR

### LINK (2-60 VARIANT "A")

#### 1. Renewal of the link end-piece bushing.

---

##### PARTS REQUIRED FOR REPAIR

---

Bushing No. 301-177-501-0 or No. 301-177-501-1  
301-177-501-2  
301-177-501-3

Bushing No. 301-178-201-0 or No. 301-178-201-1  
301-178-201-2  
301-178-201-3

---

- A. Removal of the existing bushings
- (1) Machine out bushing or bushings not within limits.
- B. Checking the bores which accommodate the bushings.
- (1) Check that bore diameters are within limits prescribed in Table 1.
- 1st case - the diameter is within limits : select bushing to be installed.
- 2nd case - the diameter is not within limits : bore resizing is necessary.
- C. Rework of bores accommodating the bushings, if required
- (1) When bore diameter is out of limits, rework it so as to obtain the nearest oversize dimension prescribed in Table I.
- D. Bushing installation
- (1) Select (match) the bushings to be installed, according to the accommodating bore diameters, and in compliance with dimensional requirements of Table I.
- (2) Fit the bushings after having them shrunk in liquid nitrogen (P 441).
- E. Dimensional inspection
- (1) Check the link bore center-to-center dimension as shown on figure 401.

FOLLOWER PETAL (3-30)

1. Re-shaping the petal.

---

PARTS REQUIRED FOR REPAIR

---

A. Re-shaping.

Re-shape the petal, at room ambient temperature, using a mallet, with the petal resting on hard-wooden blocks.

B. Inspection for soundness.

Water washable fluorescent penetrant inspect part, as per process M 502 B; chapter 70-20-10. If cracks are present, refer to chapter "Inspection" of the Manual.

C. Dimensional inspection.

The following permanent distortions are acceptable provided that :

- . twisting, as measured on petal lateral edges, is less than 0,3 mm (0.012 in).
- . bending of the lateral edges is less than 0,4 mm (0.015in)
- . twisting of the stop attachment pad is less than 1°.
- . flatness error of the stop attachment pad is less than 0,3 mm (0.012 in).
- . defect in orientation of the petal front positioning lugs is less than 0,3 mm (0.012 in).

## FOLLOWER PETAL (3-30)

### 2. Elimination of cracks affecting the central rib through reworking.

#### PARTS REQUIRED FOR REPAIR

##### A. Removal of cracks

- (1) Remove cracks using a grinding wheel or a dental type end-milling cutter as per indications shown on figure 401.

NOTE : Keep removal of parent metal at a strict minimum, while making sure that crack has been completely removed out.

- (2) Finish rework by blending lengthwise to remove all radial tool marks.

##### B. Inspection for soundness.

Water washable fluorescent penetrant inspect part, as per process M 502 B, chapter 70-20-10.

If any crack is found, scrap the petal.

4. Reconditioning the petal lug recesses (accommodating the stops -20-) by filler welding.

---

PARTS REQUIRED FOR REPAIR

---

Filler welding wire P 3020

---

A. Filler welding.

- (1) Grind out the broken area of lug so as to weld on a sound zone of parent metal.
- (2) Argon arc filler weld the lug recess as per the instructions detailed in chapter 70-35-10.

- Filler welding wire P 3020
- Weld class B2

NOTE : Using an oxy-acetylene torch preheat zone to be filler welded at about 300°C.

B. Weld inspection.

Inspect weld class B2 as per instructions detailed in chapter 70-35-80.

- Water washable fluorescent penetrant inspect per process M 502 B, chapter 70-20-10.
- X-ray inspect welds per chapter 70-20-30.

C. Machining.

Machine the lug recess in accordance with the dimensional requirements shown on figure 401.

D. Dimensional inspection.

Check that the petal dimensions are in conformity with the requirements of figure 401.

LEVER (3-320)

1. Fitting Bushings to Restore the Bores in the Lever-and-Yoke

Joint

---

PARTS REQUIRED FOR REPAIR

---

Bushing No. 002-003-327-6

---

A. Machining the Lever

- (1) Mill the bores to remove flaws as shown in Fig. 403.

NOTE : Any bushings already in the bores are to be ground out, and their recesses slightly reworked as necessary.

- (2) Machine the side faces of the lever to the dimension specified in Fig. 401.

NOTE : In case of bores with bushings in, this operation is dispensed with.

B. Machining the Bushing

- (1) Depending on the diameter given the lever, readjust two repair bushings in such a way as to produce an interference fit of 0 to 0,029 mm (0 to 0.011 in).

C. Fitting the Bushings

- (1) Insert the bushings, previously shrunk in liquid nitrogen (P441) into the corresponding recesses.

NOTE : Make sure that the bushing rims bear firmly against the lever face.

D. Reworking

- (1) Rework the bushing bores and faces into conformity with the values and dimensional requirements specified in Fig. 401.

## REPAIR

### TWIN YOKE (4-50/80)

#### 1. Fitting Bushings to Restore the Bores in the Twin Yoke.

---

#### PARTS REQUIRED FOR REPAIR

---

Bar P3623 (KC 20 WNX); 12,7 mm (0.50 in.) Dia Mini  
Brazing Powder Ni.Cr.B 1055  
Cement P3196 (Microbraz 400)

---

#### A. Machining the Bores of the Twin Yokes. See figure 401.

- (1) Position and center tool No. 025-4598-78 on the machine tool table.
- (2) Position the part on the tool and secure.
- (3) Rework the bores per chapter 70-55-00 and the following indications:
  - (a) Twin yoke material: KC 25 NW (HS 31).
  - (b) Rough machining to 11,8 mm (0.465 in.) Dia using a 8 mm (0.315 in.) Dia boring cutter bar fitted with a K10 cutting tip.
  - (c) Final machining to 12,02-12,07 mm (0.4732-0.4752 in.) Dia using a 10 mm (0.394 in.) Dia boring cutter bar fitted with a K10 cutting tip.
  - (d) Remove the part from tool.

#### B. Machining of the Bushings. See figure 402.

- (1) Machine the necessary bushings in the 12,7 mm (0.50 in.) minimum diameter P3623 bar.
  - (a) For twin yoke (4-50): 2 bushings 3,5 mm (0.138 in.) wide and 2 bushings 4 mm (0.157 in.) wide.
  - (b) For twin yoke (4-80): 4 bushings 3,5 mm (0.138 in.) wide.

C. Ultrason Cleaning of the Parts to be Brazed.

- (1) Degrease by immersion in an alkaline solution. Bath with ultrasonic steering if possible.
  - (a) ARDROX PST39.
  - (b) Concentration: 30 g/l.
  - (c) Duration: 13 min  $\pm$  15 seconds.
- (2) Rinse by immersion in fresh water, with ultrasonic steering, if possible.
  - (a) Duration: 13 min  $\pm$  15 seconds.
- (3) Rinse by immersion in hot demineralized water.
  - (a) Immersion duration 12 min + 15 seconds.
  - (b) Dripping duration: 1 min  $\pm$  15 seconds.
- (4) Clean in a P456 (Flugene 113) bath with ultrasonic steering.
  - (a) Immersion duration: 5 min.
  - (b) Dripping duration: 45 seconds.
- (5) Rinse by immersion in a P456 bath.
  - (a) Immersion duration: 2 min.
  - (b) Dripping duration: 45 seconds.
- (6) Dry with P456 vapour.
  - (a) Immersion duration: 1 min.
  - (b) Dripping duration at the coil level: 1 min.
  - (c) Dripping duration over the tank: 1 min.

D. Brazing of the Bushings. See figure 403.

- (1) Stir Ni.CR.B 1055 brazing powder with P3196 (Microbraz 400) cement to obtain an homogeneous paste to be applied using a pneumatic syringe fitted with a 0,4 mm (0.016 in.) inner diameter needle.
- (2) Position the bushings in their recess.

OVERHAUL

SNECMA

- (a) Fit a 15,05 mm (0.5925 in.) calibrated shim between the 4 mm (0.16 in.) wide ribs.
- (b) Apply a brazing past bead on the bushings fitting side.
- (3) Position the twin yoke on stumatite shims in a vacuum furnace.
  - (a) Residual pressure of less than 0.001 Pa.
- (4) Perform the following brazing cycle.

NOTE: - Temperature are given with a + or - 10°C (-18°F) tolerance.  
- Temperature holding times are given with a 0-20% tolerance.

- (a) Heating from 20°C (68°F) to within 400-500°C (752-932°F) in more than 30 min.
- (b) Degazing holdover for 15 min minimum then return to the original pressure.
- (c) Heating to 950°C (1742°F) in more than 30 min.
- (d) Homogenizing holdover for 15 min at 950°C (1742°F).
- (e) Heating from 950°C (1742°F) to 1200°C (2192°F) in less than 45 min.
- (f) 10 to 20 min holdover at 1200°C (2192°F).
- (g) Vacuum or argon cool to 1000°C (1832°F).

#### E. Brazing Check.

NOTE: X-ray inspection on the brazed joint is not possible. Only the visual examination is to be carried out.

- (1) Perform a brazing check, class B2 as per instructions detailed in chapter 70-40-80.
  - (a) Negative fillet at the exposed edge joint is acceptable if joining line is gradual, and if the braze material is visible.  
In doubt, inspect as per process M503A; chapter 70-20-10. No indication allowed.

F. Machining the Bores of the Bushings. See figure 404.

- (1) Position and center tool No. 025-4598-78 on the machine tool table.
- (2) Position the part on the tool and secure.
- (3) Rework the bore of the bushing to 10,000-10,022 mm (0,39370-0.39457 in.) Dia using a 8 mm (0.315 in.) Dia boring cutter bar fitted with a K10 cutting tip. Perform finition using a hard reamer, if necessary.
- (4) Chamfer according to figure 404.
- (5) Remove the part from tool.

G. Inspection.

- (1) Perform a dimensional inspection of the bores in the bushings according to figure 404.

H. Marking.

- (1) Mark "REP 1" per method M21 of CHAPTER 70-10-10 and indications given in figure 404.

REPAIR

CONVERGENT SECTION (4-110)

1. Re-shaping the convergent duct.

---

PARTS REQUIRED FOR REPAIR

---

A. Re-shaping.

Re-shape the duct, at room ambient temperature, using a mallet and blending it with adjacent contour.

B. Inspection for soundness.

Perform a water washable fluorescent penetrant inspection as per process M 502 B, chapter 70-20-10.  
If cracks are found, refer to chapter "Inspection" of the Manual.

2. Crack. Filler Welding.

---

PARTS REQUIRED FOR REPAIR

---

Filler welding wire P 3020 (KC 20 WNX)

---

CAUTION : COMPLIANCE WITH THE WELDING REQUIREMENTS GIVEN IN  
THIS REPAIR IS ESSENTIAL.  
NO DEVIATION FROM THESE REQUIREMENTS IS ALLOWED.

A. Introduction.

This repair scheme applies when the following damage are present :

- Cracks affecting assembly weld seams (welded joints) of flanges, bosses and liners.
- Cracks emanating from a weld seam or from a hole edge and progressing through sheet metal of liners provided they do not feature ramifications and are not located within a burnt area.

B. Weld-Filling the Cracks.

- (1) Fill weld cracks as instructed in chapter 70-35-10.

NOTE : If crack originates from a hole, plug weld the hole in the same conditions as for the cracks, then drill hole again as specified on Figure 401 of repair scheme REP 4-110-3.

CAUTION : COMPLY WITH THE WELDING REQUIREMENTS BELOW :

1. FILL WELD CRACK AS PER CHAPTER 70-35-10 PARA. 5.A.(3).
2. ARGON ARC WELD, CLASS B2.
3. FILLER WELDING WIRE P 3020, DIA. 1,2 MM (0.047 IN.)  $\pm$  30 %.

C. Inspection of Welds.

(1) Inspect welds, class B2, as per chapter 70-35-80.

- water washable fluorescent penetrant inspect per process M 502 B, chapter 70-20-10.

- X-ray inspect per chapter 70-20-30.

CAUTION : FOR WELD INSPECTION, COMPLY WITH THE FOLLOWING REQUIREMENTS :

1. ACCEPTANCE CRITERIA FOR VISUAL EXAMINATION AND DYE PENETRANT TEST AS PER CHAPTER 70-35-80.

2. ACCEPTANCE CRITERIA FOR X-RAY EXAMINATIONS AS PER 70-35-80.

3. X-RAY INSPECTION TECHNICAL DATA :

3. Patch Welding Repair.

---

PARTS REQUIRED FOR REPAIR

---

Sheet metal P 3320 ; thickness 1,5 mm (0.591 in.)  
(KC 20 WNx)

Filler welding wire P 3020 (KC 20 WNx)

Boss No. 301-228-001-0

Union No. 301-227-901-0

Rivet No. 21217 TC. 4010 (650-025-103-0)

---

CAUTION : COMPLIANCE WITH THE WELDING REQUIREMENTS GIVEN IN THIS REPAIR IS ESSENTIAL. NO DEVIATION FROM THESE REQUIREMENTS IS ALLOWED.

A. Requirements Related to the Installation of Patches.

- (1) The requirements pertaining to the patch installation are given in chapter 70-35-10.

NOTE : If applicable, allow for installation of bosses provided for the pressure-tapping unions.

B. Patch Preparation.

- (1) The patches shall be cut out from :
- Sheet metal P 3320, 1,5 mm (0.591 in.) thick, or from a sound area of a scrapped convergent section.
- (2) The patch dimensions will depend on how large are the damages found. However, their shape must comply with the requirements of chapter 70-35-10.

C. Patch Installation.

- (1) Argon arc weld the patches as per the instructions detailed in chapter 70-35-10.

CAUTION : COMPLY WITH THE WELDING REQUIREMENTS BELOW :

1. TACK-WELD THE PATCH THROUGH ONE THIRD OF MATERIAL THICKNESS, WITHOUT USING FILLER METAL (PITCH : 10 MM APPROX.) (0.39 IN.).

- (2) Argon arc weld the bosses as per instructions detailed in chapter 70-35-10.

- filler welding wire P 3020.

- weld class B2.

NOTE : Prior to welding, locate the boss as shown on figure 401.

CAUTION : FOR WELDING REQUIREMENTS, REFER TO PARA. C.(1). ABOVE.

- (3) Inspect weld, class B2, as per chapter 70-35-80.

- water washable fluorescent penetrant inspect as per process M 502 B, chapter 70-20-10.

- X-ray inspect as per chapter 70-20-30.

CAUTION : FOR WELD INSPECTION REQUIREMENTS, REFER TO PARA. C.(2) ABOVE.

- (4) Locate the union and transfer drill the rivet holes as shown on Figure 401 and according to the instructions detailed in chapter 70-50-10.

- (5) Rivet the union to the boss as shown on Figure 401 and according to the instructions detailed in chapter 70-50-10.

- (6) Inspect riveting as per instructions detailed in chapter 70-50-80.

- (7) On the gaspath side of the convergent section, grind rivet heads and union flush with the boss.

#### E. Dimensional Inspection.

Check that dimensions of the convergent section are in accordance with the requirements shown on Figure 401.

CONVERGENT SECTION (4-110)

6. Reconditioning the Front Flange Inner Contact Surface through Metal Spraying (Metallizing)

---

PARTS REQUIRED FOR REPAIR

---

Cobalt alloy powder (fine) P 3205  
Nickel/aluminium powder P 3203

---

A. General.

- (1) Depending on the extent of the defect, it may be necessary to apply an undercoat before spraying of the final coat.  
The total thickness of the coating must not exceed 1,3 mm (0.052 in.).
- (2) If the part has already been reconditioned through metal spraying, remove metallization as instructed under para. B.

B. Removing the deteriorated metallization

- (1) Remove the damaged metallization by abrasive blasting according to method M 103 A in Chapter 70-15-20 "CLEANING AND REMOVAL OF COATINGS".

NOTE : Omit the degreasing operation. Protect the surfaces surrounding the area to be abrasive blasted using metal shields.

C. Dimensionally inspect the area to metal sprayed

NOTE : This operation is required only if the inner contact surface was previously metallized.

- (1) Measure and record the average diameter of the front flange inner contact surface in planes P1 and P2.

This check allows to determine the thickness of metal spraying required in the various planes of the inner contact surface.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Checking method (Ref. Fig. 401)

CAUTION : A 10°C TEMPERATURE VARIATION RESULTS A  
0,13 MM (0.00512 IN.) LINEAR CHANGE ON THE  
FLANGE DIAMETER.

The average inner diameter of the front flange in plane P1, then in plane P2, is found by working out the arithmetical mean of the 18 values recorded in the plane concerned.

- (a) On the inner diameter, mark 18 generatrices equally distributed on the front flange half-circumference.

CAUTION : IN ANY CASE, MARKING MUST NOT DETERIORATE THE SURFACE CONDITION OF THE FLANGE INNER DIAMETER.

- (b) Using the resizing tool SC 118, restore the roundness of the front flange.

- (c) Calibrate the TESA UNIMASTER gage  
- TESA S.A. 1020 - RENENS - VD/SWITZERLAND  
Agent in France : SYNERGIE, 27 avenue Philippe  
Auguste - 75011 PARIS - Tel. 357.21.00).

Fit the gage with :

- 1 The extension tubes required for obtaining the dimension to be checked.

- 2 The supports - correctly adjusted - to ascertain the measuring plane (P1 then P2).

- (d) Bear the gage supports on to the flange edge and measure.

- (e) Repeat this operation in line with the 18 marks.

D. Metallizing the front flange inner contact surface

- (1) Prepare the area to be metal sprayed as instructed in Chapter 70-65-20 "SPRAYING OF COATINGS USING A PLASMA TORCH".

78-12-01

REP 4-110-6

Page 402

Sep 30/78

OLYMPUS 593

MK.610-14-28  
OVERHAUL

NOTE : Perform dry abrasive blasting using corundum 160 (P137) at a pressure of 3,5 bars (51psi).

- (2) Carry the metal spraying as instructed in Chapter 70-65-20 "SPRAYING OF COATINGS USING A PLASMA TORCH" in compliance with the requirements shown on Figure 402 and the following additional instructions :

- (a) Spraying of an undercoat, if applicable :  
Nickel/aluminium powder P 3203  
Maximum coat thickness 1 mm (0.039 in.)
- (b) Spraying of final coating :  
Cobalt alloy powder material P 3205  
Maximum coat thickness material P 3205

NOTE : Carefully blend out the metal coating at one end by thinning out the metallization as shown on Figure 402.

- (3) If required, smooth the surface discontinuities by sanding with an emery cloth.

#### E. Inspection

- (1) Inspect the metallization as specified in Chapter 70-65-80 "INSPECTION OF COATINGS".
- (2) Dimensionally inspect the front flange inner contact surface as indicated in Figure 402.  
The inspection method is similar to that defined under para. C. (2).

#### F. Marking

- (1) Following the part number, mark "REP6" as per Method M 28 of Chapter 70-10-10 "METHODS OF MARKING".

JOINTING SEGMENT (4-120)

1. Re-shaping

---

PARTS REQUIRED FOR REPAIR

---

A. Re-shaping.

Using a mallet and working at room ambient temperature, re-shape the segment by blending it with adjacent contour.

B. Inspection for soundness.

Carry out a water washable fluorescent penetrant inspection as per process M 502 B, chapter 70-20-10.

In case of cracks, carry out a weld built-up in accordance with REP 4-120-2.

Filler welding WIRE P3020 (KC 20 WNX)  
Solvent P325 (ACETONE)  
or P422 (METHYL ETHYL KETONE)  
or P616 (GENKLENE LV)

---

A. General

This repair is applicable:

- If distance between different cracks is at least 0.12 in. (3 mm).
- If cracks are not within a burned area.

B. PREPARATION

- (1) Make a cutout along the cracks with a 0.06 in. (1,5 mm) thick grinding disk fitted on a portable grinding tool.
- (2) Clean areas to be welded with a cloth moisted with solvent P325 or P422 or P616.

C. Cracks filler welding

- (1) Fill the cracks as specified in chapter 70-35-10.
  - filler welding wire: P3020,
  - weld class: B1.

D. Inspection

- (1) Inspect the welding as specified in chapter 70-35-80, class B1.
  - Carry out a water washable fluorescent penetrant check, as per process M502B, chapter 70-20-10.

- E. Dress the weldings to the thickness of the segment 0.03 in. (0,8 mm).

**A. General**

In some cases, the installation of a riveted patch may necessitate the removal of riveted parts in order to facilitate the repair-work or to comply with the requirements related to installation of patches.

**B. Requirements related to installation of patches**

- (1) If damages are found at a distance less than 15 mm (0.591 in) from a riveted part, cut out the sheet metal so that shape of patch mates with the riveted part..
- (2) If damages progress beneath the front or rear plates, un-rivet the plates entirely to carry out the repair.

**C. Patch preparation****78-12-01**

OVERHAUL

(1) The patches may be cut out from :

- a sound area of scrapped fairing,
- a new ring,
- a piece of sheet metal P 3301 or P 3302, thickness 0,4 mm (0.016 in) shaped to contour of the area to be repaired in compliance with the requirements shown on figure 401.

(2) The patch dimensions will be scaled in relation to the damages found. However, their shape must comply with the requirements of chapter 70-50-10 "RIVETING".

D. Patch installation

- (1) Unrivet adjacent parts if required, in order to facilitate accomplishment of repair.
- (2) Riveting of the patch is to be accomplished in accordance with the instructions detailed in chapter 70-50-10 "RIVETING" and requirements shown on figure 401.
- (3) Inspect the riveting in accordance with the instructions in chapter 70-50-80 "RIVETING".

E. Re-installation of the un-riveted parts

The following instructions give all data required for the re-installation of un-riveted parts.

NOTE : IF THE UNRIVETED PARTS ARE DAMAGED, INSTALL NEW PARTS

(1) For each case, two methods are provided :

1st method : Riveting as specified for new parts

2nd method : Riveting with a rivet that has a diameter 0,8 mm (0.031 in) above standard diameter.

(2) Preparation of parts and riveting must be carried-out in compliance with instructions specified in chapter 70-50-10 "RIVETING" and instructions shown figure 401.

Rivet data are given figure 401 sheet 8.

(3) Inspect riveting as per instructions chapter 70-50-80 "RIVETING".

## REPAIR

### NOZZLE CLOSING MANIFOLD (5-90)

#### 2. Replacement of a manifold segment

---

#### PARTS REQUIRED FOR REPAIR

---

Connecting tube assy	No. 525-990-701-0
Connecting tube assy	No. 525-609-752-0
Connecting tube assy	No. 525-609-753-0
Loop clamp	No. 525-217-154-0
Loop clamp	No. 525-217-155-0
Tube P 3400 (Z10 CNT 18)	Dia. 15,875 mm X 0,914 mm (0.625 in X 0.036 in)
Weld filler wire P 3009	(Z10 CNT 18)
Brazing metal P 3150	(Ag-Cu-Zn Cd 630)

---

#### A. General

This repair scheme contains the information needed to replace any manifold segment whatever. There is no limit set to the length of the segment replaced.

#### B. Cutting out the segment to be replaced

(1) Cut out the damaged portion, mindful of the following requirements :

- (a) The weld beads required for fitting a new segment must be made either within or 10 mm (0.39 in) from an existing bead and, mandatorily, min. 40 mm (1.57 in) from a brazed loop clamp.
- (b) When cutting out, allow for an additional length of 5 mm (0.20 in) on the manifold as a margin for subsequent adjustments.

#### C. Making a new segment

NOTE : If the new segment features a number of elements, they are to be adjusted and welded in pairs to prevent a massing of weld shrinkages, which interfere with the use of the SC 285 fixture provided.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (1) Form a tube to the manifold radius and to a length suited to the extent of damage, as indicated in Fig. 401.

Tube material : P 3400

Tube dimensions : outer diameter : 15,875 (0.625 in)  
thickness : 0,914 mm (0.036 in)

- (2) Using adjusting and tack welding fixture SC 285, adjust the different elements making up the segment, as detailed in Fig. 401.
- (3) Argon arc tack-weld the constituent elements on the SC 285 fixture, as instructed in chapter 70-35-10 "FUSION WELDING".

Filler metal P 3009

Weld class B3

NOTE : Prior to tack welding, be sure to mount the requisite loop clamps as required for the particular segments (see Fig. 401), careful of the way each is to be positioned.

- (4) Remove the segment from the fixture and argon arc weld the elements following the instructions in chapter 70-35-10 "Fusion Welding"

Filler metal P 3009

Weld class B3

- (5) Perform a class B3 weld inspection as instructed in chapter 70-35-80 "Weld Inspection", covering :  
Water washable fluorescent penetrant test by method M 502 B, chapter 70-20-10 " Dye Penetrant Inspection"  
An X-ray examination as instructed in chapter 70-20-30. "Radiographic Inspection".

D. Assembling the segment to the manifold

- (1) Adjust the segment to the manifold on the SC 285 fixture.

NOTE : If necessary, previously adjust the manifold or the new segment for proper accommodation on the fixture.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Argon arc tack weld the segment as instructed in chapter 70-35-10 "Fusion Welding".

Filler metal P 3009  
Weld class B3

- (3) Remove the manifold from the fixture and argon arc weld the segment as instructed in chapter 70-35-10 "Fusion Welding"

Filler metal P 3009  
Weld class B3

- (4) Carry out a class B3 weld inspection, following the instruction in chapter 70-35-80 "Weld Inspection", covering :  
Water washable fluorescent penetrant test by method M 502 B, chapter 70-20-10 "Dye Penetrant Inspection".  
X-ray examination, as instructed in chapter 70-20-30 "Radiographic Inspection".

#### E. Brazing the clamps

- (1) Secure the manifold on to the SC 285 tack-welding fixture, and put the loop clamps in position.

NOTE : Use a fine emery cloth to rub those manifold surfaces that are to accommodate the clamps, then cleanse them with isopropyl alcohol (P 442).

- (2) Crimp the loop clamps with crimping tool SC 138.

- (3) Induction braze the clamps as instructed in chapter 70-40-10 "Brazing" and in Fig. 401.

Brazing metal P 3150  
Brazing class B1

NOTE : Prior to brazing, put some "DURMAX" alumina in the bottoms of the tapped clamps holes to prevent the brazing solder from seeping through.

- (4) Remove any excess solder with a fine emery cloth and work a tap round inside the clamp threads.
- (5) Perform a class B1 brazing inspection as instructed in chapter 70-40-80 "Brazed Joint Inspection".

78-12-01

REP 5-90-2

Page 403

Jan 31/81

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (6) Position the manifold on the SC 285 fixture ; if necessary, adjust it for correct shape and dimensions.

#### F. Leak test

- (1) Apply blanking plugs :
  - (a) to the connecting tube assemblies serving for the supply of the pneumatic jacks (tightening torque 0,4 m.daN)
  - (b) to a supply connecting tube (tightening torque 2,5 m.daN)
- (2) Perform a leak test with petroleum (P 163)  
at a pressure of 50 bars (725 spi)  
for a period of 5 min.

#### G. Cleaning

- (1) Degrease the manifold in trichlorethylene vapour by method M 101 A, chapter 70-15-20 "Cleaning".
- (2) Circulate clean trichlorethylene (P 76 A) inside the manifold for 2 minutes, at ambient temperature.
- (3) Flush out the manifold interior by hot water (85° to 90°) circulation.
- (4) Dry the manifold in dehydrated compressed air.

#### H. Dimensional inspection

- (1) Check and, if necessary, adjust the manifold so as to ensure its proper accommodation on the SC 285 fixture, with due regard for the dimensional requirements specified in Fig. 401.

#### I. Marking

- (1) Inscribe "REP 2" next beyond the part number, using method M28 described in chapter 70-10-20 "Marking Of Parts".

NOTE : Any markings on the cut out segment should be carried over to the new one.

SPHERICAL JOINT BOX (6-110)

1. Re-shaping the mounting flange

---

PARTS REQUIRED FOR REPAIR

---

A. Re-shaping

- (1) Re-shape the spherical joint box mounting flange at room ambient temperature, using a mallet.

B. Inspection for soundness

- (1) Inspect part using post-emulsified fluorescent penetrant process M 504 B, chapter 70-20-10.

Scrap the box if any crack is disclosed.

C. Dimensional inspection

- (1) Check that the box flange does not show flatness defect greater than 0,2 mm (0,008 in).

OVERHAUL

REPAIR

RING SUPPORT ASSEMBLY (6-190)

3. Repair of the heatshield segments through installation of resistance welded patches.

---

PARTS REQUIRED FOR REPAIR

---

Wafered sheet metal P 3502 ; thickness 0,3mm (0.012 in)  
Heatshield material P 3501.

---

A. General

The repair of burnt areas or local tears affecting the heatshield sheet metal is carried out by cutting out the deteriorated area and installation of a resistance welded patch.

This repair procedure is performed without any removal of the heatshield, using a welding pistol type :

BRONZAVIA AERONAUTIQUE  
2, rue Jean Perrin  
92000 NANTERRE - FRANCE

B. Requirement related to installation of patches

- (1) Requirements concerning the installation of patches are detailed in chapter 70-35-20.  
If deteriorations are located within blending radii or at less than 15 mm (0.59 in) from the eyelets renew entirely the heatshield segment.

C. Cutting out the damaged area

- (1) The cutting out of segment to be repaired must be carried out according to the instructions of chapter 70-35-20.
- (2) Check condition of the quartz glass fiber. If it shows deteriorations due to burning, the damaged area must be renewed.

78-12-01

REP 6-190-3

Page 401

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

#### D. Patch preparation

- (1) The patches to be installed may be cut out from :
  - a sound area of a scrapped heatshield segment
  - wafered sheet metal P 3502 ; thickness 0,3 mm (0.012in)
- (2) Patch dimensions will depend on how large are the deteriorations ; their shape must comply with the requirements of chapter 70-35-20.
- (3) The patches are to be cut-out so as to provide a 10 mm (0.394 in) minimum overlap and perfect mating of the patch wafered sheet metal with the corresponding heatshield wafered sheet metal.
- (4) If required, cut out a piece of quartz glass fiber from heatshield material P 3501 so that to fit it without play in its recess.

#### E. Patch welding

- (1) Welding pistol equipment and adjustment.
  - (a) The welding pistol must be fitted with an electrode having the tip profile shown on figure 401. This configuration prevents puncture of sheet metal during welding.
  - (b) Adjustments of the welding pistol must be checked on test specimen.
- (2) Welding tests on specimen
  - (a) The welding test specimen is composed of two 100 x 30 mm (3.937 x 1.181 in) strips of metal. Both cleaning and welding of the test specimen must be carried out using the same procedure as for the part to be repaired. The test specimen must be subjected to a series of five spot welds at least.
  - (b) Inspection of the test specimen is accomplished by peeling off the spot welds. The specimen is deemed satisfactory when all the spot welds are peeled-off.

78-12-01

REP 6-190-3

Page 402

Dec 30/74

OLYMPUS 593

MK.610-14-28  
OVERHAUL

(3) Preparation of parts prior to welding

- (a) Carry out fine buffing of the heatshield area to be overlapped by the patch.

CAUTION : TAKE CARE TO FIT PROTECTIVE MASKING TO  
AVOID DETERIORATION OF THE QUARTZ  
GLASS FIBER DURING BUFFING OPERATION

- (b) Clean the areas to be welded as specified in chapter 70-35-20.

(4) Patch welding procedure

- (a) If required, locate the quartz glass fiber.

- (b) Obtain a perfect contact between parts to be welded.

NOTE : A poor contact entails an excessive welding pressure resulting in puncturing of the metal sheets.

- (c) Perform stitch welding (refer to Fig. 401)

NOTE :-Work with the flat machined at tip of electrode.  
-Connect the earthing clamp as close as possible from the welding area.

F. Weld spots inspection

- (1) Visually inspect to ensure that there is no evidence of burning or puncturing of the sheet metal.

4. Renewal of the dowel pin

---

PARTS REQUIRED FOR REPAIR

---

Dowel pin No. 301-181-500-0 or 301-181-500-1  
or 301-181-500-2

---

A. Removal of the dowel pin

Grind out the dowel pin or remove it using a pin drift.

B. Installation of a new dowel pin

- (1) Check hole condition and corresponding diameter.
  - (a) If no hole deterioration is observed, install a dowel pin adapted to the hole diameter (Table I)
  - (b) If hole deterioration is observed (out of round, scratched), re-bore it in relation to deterioration dimension as per Table I and install the appropriate dowel.
- (2) Install the dowel pin after shrinking it in liquid nitrogen (P 441)
- (3) Flare the dowel pin end as per indications in figure 401.
- (4) If required, machine the pin flush with flange face.

REPAIR

RING SUPPORT ASSEMBLY (6-190)

5. Repair of the ring support assembly through installation of welded patches.

---

PARTS REQUIRED FOR REPAIR

---

Sheet metal P3300 (Z3 NCT25), thickness : 1,2 mm  
(0.047 in.)

Weld filler wire P3030 (ND 24 FeC)

Rivet No. 650-013-073-0

Rivet No. 650-014-074-0

---

A. Conditions required for patch installation

- (1) The conditions required for patch installation are described in chapter "WELDING BY FUSION", 70-35-10.

NOTE : Bosses must be taken into account, when required.

B. Preparation of the patch

- (1) The patches shall be cut out of sheet metal P3300, 1,2 mm (0.047 in.)-thick.
- (2) Temper the patch as per method M817 in chapter "HEAT TREATMENTS", 70-45-10.
- (3) Patch dimensions depend on the extend of the damaged section. However, the patch shape shall meet the requirements defined in chapter "WELDING BY FUSION" 70-35-10.

NOTE : On adjusting, take into account an approximate 0,8 mm (0.031 in.) structural shrinkage due to tempering cumulated with the shrinkage caused by welding.

C. Patch installation

- (1) Argon-arc-weld the patch as per chapter "WELDING BY FUSION", 70-35-10.

- Weld filler wire P3030
- Class of weld : B2

**78-12-01**

REP 6-190-5

Page 401

Jan 31/81

- (2) Inspect Class B2 welds as prescribed in chapter "INSPECTION OF WELDS", 70-35-80.
- Inspection using the post-emulsified fluorescent penetrant process as per method M504 B in chapter 70-20-10.
  - X-ray radiographic inspection as per chapter 70-20-30.
- (3) Locally heat-treat the welded zone at 725°C for 8 hours in air.

NOTE : This kind of treatment was carried out by SNECMA as follows :

- One thermocouple was installed at each of the four corners of the patch and two at the center
  - Install six quartz lamps of 1200 W each at 80-100 mm (3.149-3.937 in.) away from the surface to be treated.
  - Thermally insulate this system in order to minimize heat losses.
  - Raise and maintain the temperature as long as necessary, then leave to cool in ambient air.
- (4) Sound inspect the welds using the post-emulsified fluorescent penetrant process as per method M504B in chapter "PENETRANT INSPECTION", 70-20-10.

D. Dimensional inspection

- (1) Dimensionally inspect as per figure 401.

E. Marking

- (1) Following the part number, mark REP 5 as per method M21 in chapter 70-10-20.

6. Reconditioning the primary nozzle jack mounts by applying repair-size bushings

---

PARTS REQUIRED FOR REPAIR

---

Bushing 525-600-077-1 through 5

---

CAUTION : THE TWO BUSHINGS OF A PRIMARY NOZZLE JACK MOUNT MUST ABSOLUTELY BE RENEWED.

A. Removing the bushings

- (1) Remove the damaged bushings by machining.  
Rework the bushing recesses as specified in figure 401, when required.

B. Fitting bushings

- (1) If necessary readjust the thickness of the bushing flanges so as to ensure that the after-assembly dimension between the bushings is as indicated in figure 401.

C. Mounting the bushings

- (1) Mount the bushings, previously shrunk in liquid nitrogen (P441), into their recesses.

NOTE : Make sure that the bushing flanges are firmly seated on the mounting ring.

D. Inspection

- (1) Make a dimensional check the bushings conformably to the indications in figure 401.

## ASSEMBLY

### 1. General

- A. During assembly, follow the recommendations given in chapter 70-65-00 of the manual of Standard Practices, and in the working procedures section of the Overhaul Manual.
- B. Use only tools and other special equipment nominated in the assembly procedures, and identified by a number SC... The tools are shown in the Illustrated Tools and Equipment Manual (I.T.E.M.).
- C. During assembly of bolts and nuts refer to pages 601-700 of the "Fits and Clearances" chapter for :
  - (1) The tightening torque for the nut or bolt.
  - (2) The lubrication to be applied to the nut or bolt before assembly.
- D. The clearances to be checked during assembly are identified by a number. Refer to pages 601-700 of the "Fits and Clearances", chapter for the values which must be respected.
- E. In the working procedures section of the manual, parts are referenced to the I.P.C by two numbers in brackets, the first of which is the figure number in the I.P.C, the second being the item number within that figure.

### 2. Location

The primary nozzle is assembled so as to be suitable for left-hand dressed engines i.e. 1 and 3 (see fig. 501).

It can be prepared for installation on a right-hand dressed engine by rotating it 20° clockwise from the rear and by changing the position of the following parts :

- Actuated petal for nozzle area indication.
- \* Primary nozzle area transducer
- Twin secondary nozzle mounting spherical bearings and cover plates.
- Pressure tapping tube and blank.
- Blanking of the manifold.
- Front fairing.

\*Up to primary nozzle No. 301-217-003-0 excluded.

OVERHAUL

This is given for information only, details of the operations are given in the Heavy Maintenance manual.

### 3. Assembly of the primary nozzle

#### A. Recommendations

During the various assembly operations, coat the following with anti-seizing graphite grease (P189) :

- (1) The threads of nuts and bolts.
- (2) The front flange of the convergent section (4-110).
- (3) The jointing segments (4-120).
- (4) Rubbing surfaces of the petals (3-30), (3-260) and (3-270).
- (5) The connections

NOTE : Pins (2-50) (2-220) and (2-250) should be coated with lubricating varnish X321 (P 329).

#### B. Preparation of the support ring assembly

- (1) Using the hoisting bar - tool SC 66 - place the support ring assy. on build stand - tool SC 56 - so as it rests on the front face of the mounting ring.
- (2) Fitting supports (6-60)  
(Positions 2-16-18-20-34-36 in figure 502)  
and 2-4-18-20-22-36 in figure 502A).
  - (a) Position supports (6-60).
  - (b) Fit hexagon head bolts (6-50) from inside the ring and fit self-locking nuts (6-40) without tightening.
  - (c) Fix a retaining plate - tool SC 58 - to the flange of the support ring assembly and to each support with slave bolts.
  - (d) Tighten self-locking nuts (6-40) to the prescribed torque.
  - (e) Remove the slave bolts and the retaining plate - tool SC 58 -
- (3) Fitting the yokes (6-30)  
(Positions 1-3-5-7-9-11-13-15-17-19-21-23-25-27-29-31-33-35 in figure 502).
  - (a) Position yokes (6-30).

78-12-01

- (b) Fit hexagon head bolts (6-20) from inside the support ring assembly and fit self locking nuts (6-10) without tightening.
  - (c) Fix each yoke (6-30) to the rear flange of the support ring assembly with slave bolts.
  - (d) Tighten the self locking nuts (6-10) to the prescribed torque.
  - (e) Remove the slave bolts.
- (4) Assembly of spherical bearings (6-100) (see figure 503).  
(Positions 4-16-28 in figure 502, and 10-22-34 in figure 502A).
- (a) Fit bolts (6-130) from inside the support ring assembly.
  - (b) Fit a "truarc" ring (6-120) to each bolt tool SC 91 (see figure 503).
- NOTE : Take care that the "truarc" ring is fitted the right way round.
- (c) Position the spherical bearing housings (6-110) completed with their bearings (6-100).
- ATTENTION : EACH BEARING HOUSING IS MATCHED TO A SPHERICAL BEARING. DO NOT MIX THEM.
- (d) Position the travel stops (6-90) and fit castellated nuts (6-80).
  - (e) Tighten the nuts to the prescribed torque and fit split pins (6-70) as per "Standard Practices" 70-70-50.
- (5) Inversion of the support ring assembly.
- (a) Fit the hoisting/swinging device - tool SC 24 - to the mounting ring section of the support ring assy.
  - (b) Using a hoist and lifting beam - tool SC 210 - lift the support ring assembly, invert it and lower it on the rear face of the mounting ring section on the build stand-tool SC 56.
  - (c) Remove the lifting equipment - tools SC 24 and SC 210.
- (6) Fitting the front nozzle fairing (5-10).
- (a) Offer up the front fairing (5-10) to the front flange of the support ring assembly.

OVERHAUL

- (b) Fit bush (5-50) in position 1 of figure 502.  
NOTE : The bush (5-50) is placed on the widest part of the front fairing (Identity mark H is engraved on the eyelet).
- (c) Secure the dowel with 12 point head bolts (5-40).
- (d) Fit dowels (5-30) and secure with 12 point head bolts (5-20).
- (e) Tighten the bolts to the prescribed torque.
- (7) Fitting support assemblies (5-150).
  - (a) Fit support assemblies (5-150) on the front face of the mounting section.
  - (b) Fit 12 point head bolts (5-140) from inside the mounting ring.  
NOTE : The tightening of bolts (5-140) shall be carried out on a later operation.
- (8) Fitting the nozzle closing manifold (5-90).
  - (a) Fit the support assemblies (5-80) to the manifold with hexagon head bolts (5-70).
  - (b) Position the manifold, thus assembled, to the support ring assembly.  
NOTE : Ensure that the inlets to the manifold are positioned as shown on figure 502.
  - (c) Fit support brackets (5-80) to support assemblies (5-150) with 12 point head bolts (5-60).
  - (d) Tighten bolts (5-60), then (5-70) to the prescribed torque values.
  - (e) Lock bolts (5-70) with 0,8 mm (0.031 in.) diameter locking wire (NC 15Fe).
  - (f) Fit blank (5-130) and connecting nut (5-120) to the manifold (on the left hand side, view from rear).
  - (g) Tighten the connecting nut to the prescribed torque - tool SC 31.
- C. Preparation of the convergent section (4-110).
  - (1) Lubricate the front flange of the convergent section (4-110) and the outer surface of jointing segments (4-120) with anti-seizing graphite grease (P189).

78-12-01

OVERHAUL

- (2) Place the convergent section on its front flange on the build base - tool SC 59 - and clamp it.  
Use lifting bar - tool SC 66 -
- (3) Fit joint segments (4-120) to the rear flange of the convergent section (see figure 504).

D. Assembly of the support ring assembly to the convergent section.

CAUTION : HOLD HEAD OF BOLTS (4-20, 70, 100) WHILST TIGHTENING THE ASSEMBLY SO AS TO AVOID ANY ROTATION WHICH WOULD BE DETRIMENTAL TO THE CONVERGENT SECTION.

- (1) Fit the hoisting and swinging device - tool SC 24 - to the mounting ring section of the support ring assembly.
- (2) Using the hoist and lifting beam - tool SC 210 - lift the support ring assembly, invert it, and position it on the convergent section.
- (3) Align the fool-proofing hole of the support ring assembly with the fool-proofing peg on the convergent, and enter the one in the other (position 35 in figure 502 and position 1 in figure 502A).
- (4) Check the position of the jointing segments (4-120).
- (5) Remove tools - SC 24 and SC 210 - .
- (6) Secure the support ring assembly to the convergent section.
  - (a) With special pliers - tool SC 60 - enter bolts (4-100) via the holes in the support ring assembly at the yoke (6-30) positions.
  - (b) Fit self locking nuts (4-90).
- (7) Fitting twin yokes (4-50).  
(Positions 2-14-16-18-20-22-34-36 in figure 502 and 2-4-16-18-20-22-24-36 in figure 502A).
  - (a) With special pliers - tool SC 60 - enter bolts (4-20) via the holes in the support ring assembly.
  - (b) Position the twin yokes (4-50) and fit self - locking nuts (4-10).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Place the convergent section on its front flange on the build base - tool SC 59 - and clamp it.  
Use lifting bar - tool SC 66 -
- (3) Fit joint segments (4-120) to the rear flange of the convergent section (see figure 504).

D. Assembly of the support ring assembly to the convergent section

CAUTION : MAINTAIN BOLT (4-20, 70, 100) HEADS IN POSITION DURING TIGHTENING TO AVOID ANY ROTATION THAT COULD DAMAGE THE CONVERGENT SECTION.

- (1) Fit the hoisting and swinging device - tool SC 24 - to the mounting ring section of the support ring assembly.
- (2) Using a hoist and lifting beam - tool SC 210 - lift the support ring assembly, invert it and position it on the convergent section.
- (3) Align the fool-proofing hole of the convergent assembly with the fool-proofing peg on the support ring and enter the one in the other (position 35 in figure 502 and position 1 in figure 502A).
- (4) Check the position of the jointing segments (4-120B)
- (5) Remove tools - SC 24 and SC 210 -
- (6) Secure the support ring assembly to the convergent section.
  - (a) With positioning tool - SC 60A - enter bolts (4-100B) via the holes in the support ring assembly at the yoke (6-30B) positions.
  - (b) Position the jointing segments (4-120B) and hold them in position using stops (4-95) (see figure 504A).
  - (c) Install self-locking nuts (4-90).
- (7) Fitting twin yokes (4-50).  
(Positions 2-14-16-18-20-22-34-36 in figure 502 and 2-4-16-18-20-22-24-36 in figure 502A).
  - (a) With special pliers - tool SC 60 - enter bolts (4-20) via the holes in the support ring assembly.
  - (b) Position the twin yokes (4-50) and fit self-locking nuts (4-10).

- (c) Fit hexagonal head bolts (4-40) and self-locking nuts (4-30), securing twin yokes (4-50) to supports (6-60) (Positions 2-16-18-20-34-36 in figure 502 and 2-4-18-20-22-36 in figure 502A).
- (8) Fitting twin yokes (4-80).  
(Positions 4-6-8-10-12-24-26-28-30-32 in figure 502 and 6-8-10-12-14-26-28-30-32-34 in figure 502A).
  - (a) Using clamp - tool SC 60 - enter bolts (4-70) via the holes in the support ring assembly.
  - (b) Position twin yokes (4-80) and fit self-locking nuts (4-60).
- (9) Tighten self locking-nuts (4-10) (4-30) (4-60) and (4-90) to the prescribed torques.

E. Assembly of petal actuating linkage.

ATTENTION : THE HEADS OF PINS AND BOLTS MUST BE TOWARDS THE TOP OF THE NOZZLE EXCEPT :  
- THE PETAL REAR PINS (3-130),  
- THE TWIN YOKES TO FLAPS CONNECTING PINS (3-210) AND (3-260),  
- THE JACK TO SUPPORT RING ASSEMBLY CONNECTING PINS (1-60).

NOTE : During build, do not omit to coat the rubbing surfaces of petals (3-30), (3-220) and (3-270) with anti-seizing graphite grease (P189).

- (1) Installing the support ring/convergent section on the build stand - tool SC 61 - (see figure 505).
  - (a) Fit the hoisting/swinging device - tool SC 24 - to the mounting ring section of the support ring assembly.
  - (b) Using a hoist and lifting beam - tool SC 210 - remove the assembly from the build stand - tool SC 59 - after having unclamped the convergent section.
  - (c) Lower the assembly onto build stand - tool SC 61 - and secure it by the three adjustable mountings at the spherical bearing cover plate positions (Positions 8, 20 and 32 in figure 502 and 6-18-30 in figure 502A).
  - (d) Remove the lifting equipment - tools SC 24 and SC 210 - .

OVERHAUL

- (e) Position the inspection ring - tool SC 62 - in contact with the rear flange of the convergent section (see figure 505).
  - (f) Using inspection rotor arm - tool SC 63 - check and adjust the concentricity and flatness of the rear flange of the convergent section.
  - (g) Remove the inspection rotor arm - tool SC 63 - and checking ring - tool SC 62 -
  - (h) Fit the adjusting equipment - tool SC 64 - to the build stand - SC 61 - shaft using lifting beam - tool SC 65 -
- (2) Fitting actuated petal (3-220)  
(Position 22 in figure 502 and 16 in figure 502A).
- (a) Position the actuated petal (3-220) on the twin yoke (4-50).
  - (b) Enter pin (3-210) from inside the twin yoke (4-50) and fit lever (3-230). The head of the pin is to be toward the top of the nozzle.
  - (c) Fit the grooved washer (3-200) and the U shaped pin (3-190).
  - (d) Lock by bending the two ends of the pin rearwards.
- (3) Fitting the actuated petals (3-270)  
(Positions 2-4-6-8-10-12-14-16-18-20-24-26-28-30-32-34-36 in figure 502 and 2-4-6-8-10-12-14-18-20-22-24-26-28-30-32-34-36 in figure 502A).
- (a) Position the actuated petal (3-270) on the twin yoke.
  - (b) Enter pins (3-260) on either side of the twin yoke.
  - (c) Fit the grooved washers (3-250) and U shaped pins (3-240).
  - (d) Lock by bending the two ends of the pin (3-240) rearwards.
  - (e) Repeat operations (a), (b), (c) and (d) for each of the actuated petals (3-270).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (e) Position the inspection ring - tool SC 62 - in contact with the rear flange of the convergent section (see figure 505).
- (f) Using inspection rotor arm - tool SC 63 - check and adjust the concentricity and flatness of the rear flange of the convergent section.
- (g) Remove the inspection rotor arm - tool SC 63 - and checking ring - tool SC 62 -
- (h) Fit the adjusting equipment - tool SC 64 - to the build stand - SC 61 - shaft using lifting beam - tool SC 65 -
- (2) Fitting actuated petals (3-220B)  
(Positions 14-22 in figure 502, and 16-24 in figure 502A).
  - (a) Position the actuated petal (3-220B) on the twin yoke (4-50).
  - (b) Enter pin (3-210B) from inside the twin yoke (4-50) and fit lever (3-230B). The head of the pin is to be toward the top of the nozzle.
  - (c) Fit the grooved washer (3-200B) and the U shaped pin (3-190B).
  - (d) Lock by bending the two ends of the pin rearwards.
- (3) Fitting the actuated petals (3-270B)  
(Positions 2-4-6-8-10-12-16-18-20-24-26-28-30-32-34-36 in figure 502 and 2-4-6-8-10-12-14-18-20-22-26-28-30-32-34-36 in figure 502A).
  - (a) Position the actuated petal (3-270) on the twin yoke.
  - (b) Enter pins (3-260) on either side of the twin yoke.
  - (c) Fit the grooved washers (3-250) and U shaped pins (3-240).
  - (d) Lock by bending the two ends of the pin (3-240) rearwards.
  - (e) Repeat operations (a), (b), (c) and (d) for each of the actuated petals (3-270).

OVERHAUL

- (4) Fitting the follower petals (3-30)
  - (a) Position a follower petal (3-30) between each actuated petal.
  - (b) Secure each follower petal (3-30) to the adjacent actuated petals by two stops (3-20), retained by hexagon head bolts (3-10).
  - (c) Tighten the bolts (3-10) to the prescribed torque and lock with 0,8 mm (0.315 in.) dia. locking wire (NC15Fe).
  - (d) Check clearance "X" between the follower petals (3-30) and the joint segments (4-120).
- (5) Fitting levers (3-320)
  - (a) To each yoke (6-30), fit a lever (3-320).
  - (b) Secure each lever (3-320) with a pin (3-310) (head toward the top of the nozzle). Fit a flat washer (3-300) and a castellated nut (3-290).
  - (c) Tighten each nut (3-290) to the minimum prescribed torque and fit a split pin (3-280) as per Standard Practices 70-70-50.
- (6) Fitting parts associated with the actuated petals (3-220), see figure 506.
  - (a) Position the links (3-100) on the actuated petal (3-220).
  - (b) Secure each link (3-100) with a hexagon head bolt (3-60) and a castellated nut (3-50).
  - (c) Tighten each nut (3-50) to the minimum prescribed torque and lock with a split pin (3-40) as per Standard Practices 70-70-50.
  - (d) Secure the links (3-100) to lever (3-230) with a hexagon head bolt (3-90) (head toward the top of the nozzle) and a castellated nut (3-80).
  - (e) Tighten the nut to the minimum prescribed torque and lock with a split pin (3-70) as per Standard Practices 70-70-50.
- (7) Assembly of links (3-170)
  - (a) Fit links (3-170) with the spherical bearings (3-180).

ATTENTION : THE LINKS AND SPHERICAL BEARINGS ARE  
MATCHED. DO NOT MIX THEM.

- (b) Fit two assembled links (3-170) by their smaller ends, to each of the levers (3-320). Retain with a pin (3-160) (head toward the top of the nozzle) and a castellated nut (3-150).
- (c) Tighten each nut (3-150) to the minimum prescribed torque and lock with a split pin (3-140) using Standard Practices 70-70-50.
- (d) Connect the other end of the links (3-170) to the actuated petals by a pin (3-130), entered from the left in the build position (ie. the head to the right, viewed from rear).
- (e) Secure each pin (3-130) by a castellated nut (3-120).
- (f) Tighten to the minimum prescribed torque and lock with a split pin (3-110) as per Standard Practices 70-70-50.
- (g) Check that all the petals are in contact with the setting disk - tool SC 64 -

F. Assembly of the jacks (1-30)

NOTE : Lubricate the supply tubes (1-10) connections with anti-seizing graphite grease (P189).

CAUTION : CARRY OUT NO LUBRICATION OF THE JACKS.

- (1) For each jack, position the front end fitting, with its spherical bearing, in the mounting ring of the support ring assembly.
- (2) Enter pin (1-60) from the left in the build position (i.e. the head on the right, viewed from the rear), fit grooved washer (1-50) and lock with U shaped pin (1-40).
- (3) Position the supply tubes (1-10). The connecting nuts are to be fitted and tightened to the torque prescribed in Standard Practices 70-70-30 - tool SC 30 -
- (4) Tighten the 12 point head bolts (5-140) to the prescribed torque.

NOTE : For reference only, these bolts retain the manifold supports (5-150) to the mounting ring (see NOTE B. (8) (b) page 507)

- (5) For each jack, position the rear end fitting, with its spherical bearing (with the rod in the deployed position on lever yoke (3-320)).

OVERHAUL

position) to the yoke of lever (3-320).

Tighten or slacken the end fitting by 1/2 turn to align the end fitting and lever bores (a finer adjustment may be obtained by the jack rod).

NOTE : During adjustment, ensure that the petals are always in contact with the setting disk  
- tool SC 64 -

- (6) Fit pin (1-90) (head to the top of the nozzle) and castellated nut (1-80).
- (7) Tighten to the minimum prescribed torque and lock with a split pin (1-70) as per Standard Practices 70-70-50.
- (8) Tighten the jack rear end fitting lock nut to the prescribed torque.

G. Assembly of the pressure tapping (see fig. 507)  
(Position 30 in figure 502 and position 8 in figure 502A).

- (1) Position pressure tapping tube (1-100) and screw the connection nut onto the convergent section.
- (2) Secure the other end of the tube to the mounting ring on the support ring by 12 point head bolts (1-120) and self-locking nuts (1-110).
- (3) Fitting the tube (1-100) clipping points.

(a) 12 point head bolts (1-130).

(b) Clamp (1-150) retained by a 12 point head bolt (1-140).

- (4) Tighten bolts (1-120), (1-130) and (1-140) and the connecting nut to the prescribed torques.

NOTE : Check that the tightening of these bolts does not strain the tube.

- (5) Lock bolts (1-130), (1-140) and the connecting nut with 0,8 mm (0.031 in.) dia. locking wire (NC15Fe).
- (6) Fit the storage blanking plug to the tube.

H. Fitting blank (1-180) (see fig. 508)  
(Position 6 in figure 502 and position 32 in figure 502A).

- (1) Screw the blank (1-180) onto the convergent section and tighten to prescribed torque.
- (2) Fix the locking plate (1-200) with the 12 point head bolts (1-190) and tighten to the prescribed torque.

MK.610-14-28

OVERHAUL

- (3) Lock bolt (1-190) and the blank (1-180) with 0,8 mm (0.031 in.) dia. locking wire (NC15Fe).
- (4) Fitting blanking covers (6-160).  
(Positions 8-20-32 in figure 502 and 6-18-30 in figure 502A).

- (a) Enter bolts (6-180) from inside the support ring assembly.
- (b) Fit a "Truarc" ring (6-170) to each bolt - tool SC 91 -

NOTE : Take care to fit the "Truarc" ring the right way round.

- (c) Position the blanking covers (6-160) and fit castellated nuts (6-150).
- (d) Tighten the nuts to the minimum prescribed torque and fit split pins (6-140) as per Standard Practices 70-70-50.

J. Assembly of the nozzle area indication system (fig. 509)  
(Position 22 in figure 502, and position 16 in figure 502A).

NOTE : Fit the pins with their head toward the top of the nozzle (i.e. enter them from the left during assembly).

- (1) Fitting the yoke (2-300).
  - (a) Secure the yoke (2-300) to the twin yoke (4-50) using hexagon head bolts (2-290) and self-locking nuts (2-280).
  - (b) Tighten the nuts to the prescribed torque.
- (2) Fitting the yoke (2-270)
  - (a) Fit the yoke (2-270) to the inside of the mounting ring of the support ring assembly, with hexagon head bolts (2-260), flat washers (2-250) and self locking nuts (2-240).
  - (b) Tighten the nuts to the prescribed torque.
- (3) Fitting connecting yoke (2-230)
  - (a) Secure the connecting yoke (2-230) to the yoke (2-270) by a pin (2-220).
  - (b) Fit the grooved washer (2-210) and lock with U shaped pin (2-200).

78-12-01

Page 520  
Apr 30/93

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (4) Fitting the support assembly (2-120)
  - (a) Position the yoke of the support assembly (2-120) on the connecting yoke (2-230).
  - (b) Secure with pin (2-160) and grooved washer (2-150) locked by the U shaped pin (2-140).
  - (c) Secure the lower part of the support assembly (2-120) to the yoke (2-300) by a pin (2-190) and a grooved washer (2-180) locked by a U shaped pin (2-170).
  - (d) Fit the spring (2-130) which connects the support assembly (2-120) to the support ring assembly using the spring tensioning device - tool SC 191 -
- (5) Fitting the nozzle transducer (2-90)
  - (a) Secure the nozzle transducer (2-90) to the support assembly (2-120), along with the protective plate (2-110) by 12 point head bolts (2-100).
  - (b) Tighten the bolts to the prescribed torque.
- (6) Fitting the detection system actuating lever (2-60)
  - (a) Fit the threaded end fitting (2-70) and hexagonal nut (2-80) to the link (2-60).

NOTE : Nut (2-80) is to be tightened only after the adjustment of the detection system.
  - (b) Slide the link (2-60) onto the transducer spindle, fit the grooved washer (2-20) and lock temporarily with U-shaped pin (2-10).
  - (c) Set the transducer to the "electrical-zero position" using dowel - tool SC 96 - .
  - (d) Set the nozzle area to "Mean Aj" using the adjustment disk - tool SC 95 - .
  - (e) With link (2-60) secured to the transducer, offer the other end up to the yoke on the lever (3-230) .
  - (f) Adjust the threaded endpiece (2-70) until the pin (2-50) can be freely engaged.
  - (g) Remove dowel - tool SC 96 - .
  - (h) Remove the link and locate it in position on rigging template - tool SC 248 - .
  - (j) Torque hex. nut (2-80) to the prescribed torque value and wire lock.

78-12-01

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (k) Remove the link from the rigging template and locate it in position on the transducer.
- (l) Fit the grooved washer (2-20) and lock using U-shaped pin (2-10).
- (m) Fit the pin (2-50), the grooved washer (2-40) and lock with pin (2-30).
- (n) Perform tests specified as from page 701.
- (p) Remove the primary nozzle from the assembly support stand - tool SC 61 - using the hoisting and swinging device - tool SC 24 - and lifting beam - tool SC 210 - and lower it on the storage stand - tool SC 218.

**OLYMPUS 593**MK.610-14-28  
OVERHAUL**FITS AND CLEARANCES****1. General****A. Layout**

- (1) The table of clearances gives the machining tolerances of parts in new condition and acceptable wear limits. The values are expressed in millimeters.

ITEM FIG.	IPL FIGURE ITEM	NOMINAL DIMENSION	TYPE	CLEARANCES		MAX LIMIT	CAT.	REMARKS SELECTIONS
				MIN	MAX			
1	2	3	4	5	6	7	8	9

- (2) The item numbers in column (1) by reference to the corresponding figure provide a means of locating the clearance or dimension to be measured.
- (3) The item numbers in column (2) identify the parts in the "Illustrated Parts List". (FIGURE + ITEM).
- (4) Column (3) gives the manufacturing dimensions of parts together with the machining tolerances.  
In the case of two parts which form an assembly the first one is always the male part.
- (5) The code letters in column (4) indicate the type of clearance.
- A denotes an axial clearance
  - D denotes a diametral clearance
  - L denotes a side clearance
- (6) Columns (5) and (6) give the clearance (symbol J) or the interference (symbol S) which result from the manufacturing tolerances.
- Column (9) is used to indicate that a smaller clearance than that resulting from the manufacturing tolerances is required. This reduced clearance is obtained by selective assembly of parts.

**78-12-01**Page 601  
Dec 30/74

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (7) The digits or letter in column (8) give the clearance category the definition of which is as follows :

- M - Check or adjustment to be carried out at each assembly
- 1 - Check to be systematically carried out.
- 2 - Check to be carried out if the condition of parts makes it necessary.
- 3 - Dimensions intended for use by Design Offices (not applicable in this document).
- 4 - Check to be systematically carried out on the equipments intended for ageing studies (Sampling)

B. Max. after wear (column 7)

- (1) The MAX. LIMITS are the maximum wear limits within which a part can be accepted for a further period of use.
- (2) Parts worn beyond these limits will be either repaired in accordance with the instructions given in chapter "REPAIR" or replaced as applicable.
- (3) Therefore the values given in this column will change as experience is gained with the repaired equipment or the equipment intended for ageing studies.
- (4) This kind of information may be entered in this column.

(a) Clearance

The maximum clearance or the minimum interference between two parts will be given only if they are matched parts. The distribution of this clearance on the male or female part is left to the discretion of the repairer.

(b) Dimension

In order to preserve interchangeability, the degree of permissible wear on male and female parts is given, thus ensuring a correct assembly at all times whatever the mating parts may be.

## 2. Torque values

As torque is variable with respect to lubrication, we indicate in this paragraph both the torque and lubrication to comply with during assembly. Bolts, nuts... bear the I.P.L. references.

Bolts or nuts Fig. Item (I.P.L.)	Lubrication when assembly	Torque value
1-10	Lubricate thread of the two union nuts with anti-seizing graphite grease (P189)	0,7 daN.m (5.16 lbf.ft)
1-80	Lubricate thread with anti- seizing graphite grease (P189)	0,7 to 0,8 daN.m (5.16 to 5.90 lbf.ft)
1-100	Lubricate thread of union nut with anti-seizing graphite grease (P189)	1,8 to 2 daN.m (13.2 to 14.75 lbf.ft)
1-110	Lubricate thread with anti- seizing graphite grease (P189)	0,4 to 0,5 daN.m (2.95 to 3.68 lbf.ft)
1-130	Lubricate thread with anti- seizing graphite grease (P189)	0,95 to 1,05 daN.m (7 to 7.74 lbf.ft)
1-140	Lubricate thread with anti- seizing graphite grease (P189)	0,95 to 1,05 daN.m (7 to 7.74 lbf.ft)
1-180	Lubricate thread with anti- seizing graphite grease (P189)	1,8 to 2 daN.m (13.26 to 14.75 lbf.ft)
1-190	Lubricate thread with anti- seizing graphite grease (P189)	0,95 to 1,05 daN.m (7 to 7.74 lbf.ft)
2-80	Lubricate thread with anti- seizing graphite grease (P189)	0,6 to 0,8 daN.m (4.41 to 5.90 lbf.ft)
2-100	Lubricate thread with anti- seizing graphite grease (P189)	0,95 to 1,05 daN.m (7 to 7.74 lbf.ft)

**OLYMPUS 593**MK.610-14-28  
OVERHAUL**TESTING****1. General**

The tests to be carried out after overhaul of the primary nozzle comprise a leak test and an operational test.

**2. Test equipment characteristics****A. Nozzle supply**

- (1) Test fluid            dehydrated, de-oiled compressed air
- (2) Supply pressure       0,2 - 3,5 bar (2.9 - 50.8 psi)
- (3) Supply flow           40 m<sup>3</sup>/h (1413 cu ft/h)
- (4) Fluid temperature    ambient
- (5) Filter mesh           5 $\mu$  (5 microns)

**B. Control, instrumentation and inspection**

	SCALE	ACCURACY	REMARKS
Supply pressure	0-1 bar		
	(0 - 14.51 psi)	1%	
	0-6 bar		
	(0 - 87.0 psi)	1%	
Air flow measurement	4 m <sup>3</sup> /h - 40 m <sup>3</sup> /h	2%	Rotameter
	(141 - 1413 cu ft/h)		

**3. Testing****A. Connections**

- (1) Connect the compressed air supply to the jack closing circuit using the adaptor - tool SC 238 - Tighten the nut using the 37-tooth wrench - tool SC 31, and the handle for torque wrench - tool SC 45.

NOTE : Check that connector (5-120) is tightened, blanked and locked.

**B. Leak test**

- (1) Progressively increase the supply pressure to 3,5 bar gauge (50.8 psig), then reduce it to 2,5 bar gauge (36.3 psig).

**78-12-01**Page 701  
Dec 15/75

OLYMPUS 593

MK.610-14-28  
OVERHAUL

The leak flow must be less than or equal to 15 m<sup>3</sup>/h  
(529 cu ft/h).

C. Operational test

- (1) Check that the primary nozzle petals close at a supply pressure equal to or less than 0,300 bar (4.35 psi) ; the return to the "open" position is carried out manually.

NOTE : If pressure is greater than or equal to 0,2 bar (2.90 psi), check position of pins and links.

CAUTION : ENSURE THAT IN ANY OPEN OR CLOSED POSITION, THE TRANSDUCER CONTROL LEVER NEVER MECHANICALLY INTERFERES WITH THE TRANSDUCER SUPPORT.

## STORAGE

### 1. General

This chapter gives all information on primary nozzle storage which can be carried out by repair organization prior to and following overhaul.

### 2. Storage requirements

#### A. Storage in container

It shall be of long duration (more than 3 months).

No special conditions. The container shall be sheltered from sun and bad weather.

#### B. Storage out-of-container

- (1) Take the primary nozzle out of the container (see paragraph 3). and install it on the rest stand - tool SC 218 -
- (2) Store in premises where the relative humidity remains below 60%.
- (3) Protect the equipment with a non-hermetic, anti-dust cover made of vinyl chloride.
- (4) Stick the document wallet on the equipment.
- (5) Check condition of the equipment every three months when relative humidity is less than 60%. If above 60%, check every month.

### 3. Removal of primary nozzle from container (Fig. 901)

#### A. Installation on waiting stand

- (1) Remove the container seals.
- (2) Remove the cover using a hoist and slings.
- (3) Position the hoisting bar - tool SC 57 - and take the weight of the nozzle with a hoist.
- (4) Remove the upper retaining blocks.
- (5) Lift the primary nozzle, position it on the rest stand - tool SC 218 - and secure it.
- (6) Remove the hoisting bar - tool SC 57 -

Figure 901

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

#### B. Returning empty containers

The container-to-contents connecting parts must be collected when contents are removed from the container, and must be re-assembled in their respective locations in the container.

- (1) Fix the upper retaining blocks in the respective locations.
- (2) Close and lead-seal the container for the return.
- (3) Obliterate the notices written on the black rectangle on the container.

#### 4. Placing the equipment in the container (fig. 902)

##### A. Preparation of the container

- (1) Place the container in the same area as the jet-pipe sufficiently in advance of the packaging operation for it to attain the same temperature as the jet-pipe, in order to avoid all risk of condensation.
- (2) Check the condition of the container (general cleanliness, lifting and handling rings, document box, closing devices, notices etc...).
- (3) Unlock the cover from the base and open the container using a hoist and a four branch sling.
- (4) Clean the joint faces and check the condition of the seal, flexible mountings and internal fittings.
- (5) Remove the upper retaining blocks from the support mount.
- (6) Wipe the inside walls of the container to remove any traces of humidity.

##### B. Preparing the primary nozzle

- (1) Check for the presence of the appropriate blanks for delivery, and that they are locked. Also check that the petals are locked in the closed position (and retained by lock-wire).
- (2) Check the presence of the wallet containing the nozzle documents.
- (3) Wipe the primary nozzle with clean, dry cloth.

### C. Packing

- (1) Remove the jet-pipe from the rest stand - tool SC 218 - using hoisting bar - tool SC 57 -
- (2) Offer up the jet-pipe to the container, lower gently and engage the support ring in the two lower side supports.
- (3) Place the two upper support blocks onto their locations on the support mount.
  - (a) Centre the retaining block onto the locking studs having slackened the nut and locking nut on the locking screw.
  - (b) Fit both supports with the bolts and washers not tightened.
- (4) Centre and bring the two retaining blocks into contact with the support ring by tightening the locking screws
- (5) Tighten the retaining block fixing bolts and lock them in pairs with locking wire.
- (6) Tighten the nut and the lock-nut on the locking screw, and lock them together.
- (7) Remove the hoisting bar - tool SC 57 -
- (8) Close the container
  - (a) Place the cover on the base.
  - (b) Lock by means of the clamps.
  - (c) Lead-seal two opposite clamps.
- (9) Place in the documents box the wallet containing :
  - module log sheet
  - release note
  - storage instructions
- (10) Lead seal the documents box
- (11) Mark on the container, using stencils :
  - the serial number of the primary nozzle
  - the date of packing
  - the duration of storage.

## INTRODUCTION

### 1. Purpose

This illustrated parts list gives a complete list of the components required for the overhaul of an equipment.

### 2. Illustrated parts list

The illustrated parts list is divided into three parts :

- Introduction
- Numerical index
- Detailed parts list

#### A. Numerical index :

For the sake of clearness, this repertory is divided into two parts :

- (1) Index of manufacturers references beginning with a letter.
- (2) Index of manufacturers references beginning with a figure.

These indexes include all the manufacturers references for the parts described in the detailed nomenclature in alphabetical or numerical order. Opposite each reference is given the chapter-section-subject-figure-item number and the quantity.

#### B. Detailed parts list.

The detailed parts list gives, in disassembly order, the list and illustrations of the parts making up the assembly concerned from the origin as shown in the example paragraph B6 effectivity.

- (1) Items index numbers.

To allow simple and speedy identification, each item is given a numerical item in 10 to 10 sequence, this item will not vary during the whole life of the item.

- (2) Original item.

To cater for systematic evolution due to modifications a "letter" variant is added to the numerical item. The letter variant "A" is given in the original document to identify all the items in original definition.

78-12-01

OLYMPUS 593

MK.610-14-28

OVERHAUL

It is given in the text part only.

(3) Modified item (Item variant).

After each modification concerning an item, the numerical item of this item is maintained but the "letter" variant progresses systematically to "B", then "C", "D" etc. (letters I, O and X are not used). This variant evolution is shown in the text and on the drawings only in the case of a change. The use of the "letter" variant added to the numerical item has been made necessary to make possible the rational use of the "effectivity Code" (usage code) such as it is presented paragraph 6 of this foreword.

(4) Indent

The detailed nomenclature is presented indented showing the relation between the various items, i.e :

1	2	3	4	5	6	7
Assembly						
	Assembly component parts					
	Sub-assembly					
	Sub-assembly attachment parts					
	*	*	*			
	Sub-assembly component parts					
	Sub sub-assembly					
	Sub sub-assembly attachment parts					
	*	*	*			
	Sub sub-assembly component parts					

(5) Quantity per assembly

The quantity indicated in the "Quantity per assembly" column is that required by the next higher assembly.

(6) Effectivity

A coded method is used to indicate parts effectivity.

This alphanumerical code indicates the installation possibilities of sub-assemblies and primary parts in relation to the next higher sub-assembly or assembly. The validity column is left blank when installation is possible in all cases.

78-12-01

OLYMPUS 593

MK.610-14-28

OVERHAUL

This code corresponds to the next higher assembly or sub-assembly item.

Figure Item	Manufacturers Reference	Description							Effectivity
		1	2	3	4	5	6	7	
1A	123450	Assembly							
1B	123451	Assembly (SB 1)							
1C	123452	Assembly (SB 2)							
1D	123453	Assembly (SB 3)							
10A	234560	. PRIMARY PART							1A
10B	234561	. PRIMARY PART (BS 1)							1BAC
10C	234562	. PRIMARY PART (BS 3)							1D
20A	345670	. SUB-ASSEMBLY							1A
20B	345671	. SUB-ASSEMBLY (BS 1)							1BAC
20C	345672	. SUB-ASSEMBLY (BS 2)							
20D	345673	. SUB-ASSEMBLY (BS 3)							
		. ATTACHING PARTS							
30A	456780	. PRIMARY PART							
		* * *							
40A	567890	. . PRIMARY PART							20A
40B	567891	. . PRIMARY PART (BS 1)							20BA
40C	567892	. . PRIMARY PART (BS-2)							20CAB
40D	567893	. . PRIMARY PART (BS 3)							20D

The above example shows that :

- The primary part index 10A can only be installed in assembly indexed 1A.
- The primary part index 10B can be installed in assemblies indexed 1A, 1B, and 1C.
- The primary part index 10C can only be installed in assembly indexed 1D.
- The sub-assembly index 20A can only be installed in assembly indexed 1A.
- The sub-assembly index 20B can be installed in assemblies indexed 1A, 1B and 1C.
- The sub-assemblies indexes 20C and 20D and their attaching parts indexed 30A can be installed in all assemblies indexed 1 and thus do not have an "effectivity" code.
- The primary part index 40A can only be installed in sub-assembly indexed 20A.
- The primary part index 40B can be installed in sub-assemblies indexed 20A and 20B.

78-12-01

INTRO 1101 - PAGE 3

DEC 30/74

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- The primary part index 40C can be installed in sub-assemblies indexed 20A, 20B and 20C.
- The primary part index 40D can only be installed in the sub-assembly indexed 20D.

(7) Figure Variant

When it is not possible to illustrate the different variants of an assembly, resulting from modifications to the basic figure, one or several supplementary illustrations will describe these variants.

These supplementary illustrations will bear the same number as that of the basic figure, followed by a letter taken in the alphabetical order (except I and O).

Whatever the number of figure variants, they will be covered by only one nomenclature.

To ascertain quickly on which figure variant the item variant is to be found, the figure variant letter will be indicated in the nomenclature, in the "index reference figure item immediately in front of the item number.

3. Using the illustrated nomenclature

The identification of a component is possible taking the following elements in consideration :

A. Through the manufacturer's reference.

Search for the manufacturer's reference in the numerical index, note the chapter-section-subject-figure-item number and refer to the corresponding nomenclature.

B. At sight of the component, without knowing its references.

Look for the figure showing the component among the illustrations this will indicate the item permitting reference to the detailed nomenclature.

LIST OF CHAPTERS		Pages
FOREWORD		1
DESCRIPTION/OPERATION		
1. General.....		1
2. Description of the twin secondary nozzle.....		1
3. Description of the bucket actuator system.....		18
4. Operation of the twin secondary nozzle assembly..		18
DISASSEMBLY		
1. General.....		101
2. Removal of seal Plates and anti-fret strips from the front framework.....		101
3. Preparation for disassembly.....		104
4. Removal of access doors (left hand twin secondary nozzle).....		105
5. Removal of access doors (right hand twin secondary nozzle).....		107
6. Removal of deflechor assembly.....		109
7. Removal of rerverser bucket assemblies.....		111
8. Removal of bucket drive pneumatic actuators.....		116
9. Removal of bucket position transmitters (indicators).....		120
10. Removal of flexibles shafts.....		121
11. Removal of ballscrew gearboxes.....		126
12. Removal of the cross-feed isolation valve.....		126
13. Removal of the P3 air feed tubes.....		128
14. Removal of electrical harnesses.....		129
15. Removal of the P3 air feed pipe supports.....		132
16. Removal of ballscrew gear box supports.....		133

## FOREWORD

1. Effectivity

Some procedures described in this manual such as assembly, repair procedures, etc... specifically relate to given types of equipment. Hence, effectivity reference numbers are used which relate equipment to procedures.

These effectivity reference numbers can take the form of either a manufacturer's reference number or a serial number.

The table drawn up below will enable you to make the association between the two sets of numbers.

R.H. Twin Secondary Nozzle		L.H. Twin Secondary Nozzle	
Manufacturer's ref No.	Serial No.	Manufacturer's ref No.	Serial No.

## DESCRIPTION - OPERATION.

### 1. General

#### A. Introduction

The twin secondary nozzle assembly (figure 1) developed by SNECMA to equip the power units of CONCORDE ; fulfils two main functions :

- (1) a convergent-divergent secondary nozzle function,
  - (2) a thrust reverser function for deceleration in flight and during landing.
- In addition, the thrust-reverser system contributes to the achievement of optimum performance in all flight configurations.

#### B. General characteristics

The twin secondary system assembly weighs approximately 1150 kg (2 535 lb). Its dimensions are :

- length..... 2100 mm ( 82.7 in)
- width..... 2800 mm (110.0 in)
- height..... 1550 mm ( 61.0 in)

#### C. Composition of the twin secondary nozzle

The twin secondary nozzle assembly comprises :

- (1) the twin secondary nozzle which carries the thrust reverser system,
- (2) the buckets and actuator system which perform the thrust reverser function.

### 2. Description of the twin secondary nozzle

#### A. General

The twin secondary nozzle is a monobloc assembly which constitutes the final section of the engine nacelles. The two twin secondary nozzles fitted to the aircraft are not identical due to the geometry of the nacelles, between two adjacent engines and the aircraft axis of symmetry.

#### B. Functions

The twin secondary nozzle assembly has the following functions :

- (1) to support the primary nozzles,
- (2) to support the buckets and their actuator system,

78-13-01

OVERHAUL

- (3) to ensure continuity of the lines of the nacelle,
- (4) to channel the secondary air during straight-jet operation and to control the expansion of gas issuing from the primary nozzles,
- (5) to transmit loads imposed on the primary and secondary exhaust systems to the air frame.

#### C. Attachment of the twin secondary nozzle assembly

The connection of the twin secondary nozzle to the nacelle is isostatic, and comprises 4 attachment points (see figure 2) :

- (1) two clevis attachments on the outer walls, carrying loads in directions X and Z,
- (2) a clevis attachment fitted to the upper section of the central wall, carrying loads in direction Y. This attachment can also take loads in direction X, in the event of failure of one of the outer wall attachments, or the lower attachments.
- (3) a clevis attachment on the lower part of the central wall, carrying load in direction X and also capable of taking load in direction Z in the event of failure of one of the outer fixation points.

#### D. Composition

The twin secondary nozzle has the form of a rectangular prism with two cylindrical bays in the lengthwise direction. It comprises basically :

- three walls forming a cell (a central wall and two outer walls) parallel to each other and inter connected by upper and lower frames,
- internal and external skin panels rigidly fixed to the framework of the twin secondary nozzle,
- removable panels which form, in effect, the hot sections of the twin secondary nozzle,
- access doors for the various actuator system elements, and for endoscope inspection of the structure,
- parts for the attachment of the primary nozzles and the buckets,
- two harnesses for indication of primary nozzle area,
- parts for the attachment of the accessories mounted on the twin secondary nozzle.

##### (1) Description of the frame-work (see figure 3)

- (a) The outer walls

OVERHAUL

They comprise two horizontal beams (1 and 2) inter-connected by stringers (3) rivetted to the beams.

The beams which transmit loads to the airframe comprise machined from-solid-sections welded together.

At the rear of these beams are situated the bucket hinge points (4).

The yokes (5) for fixing the nozzle to the nacelle are situated towards the top at the extreme front of the structure.

Towards the front, and near the horizontal centre line of the outer walls is situated a housing (6) for the primary nozzle mounting pin.

(b) The central wall

The technology of the central wall is similar to that of the outer walls. The beams carry the bucket hinge points at the rear, and the nozzle-to-nacelle fixation points at the front.

The stringers connecting the beams are fabricated from various materials : "machined-from-solid-sections-brackets-honeycomb sections".

(c) Upper and lower frame-works

These form the connection between the wall frames. They comprise machined-from-solid sections rivetted together.

In addition, the frames carry the upper (8) and lower (9) housings for the primary nozzle fixing pins.

(2) Description of skin panels

The inner and outer skins are of stainless steel honeycomb sheet. Most of the panels are rivetted to the frame-work, imparting a high degree of rigidity to the assembly, others are removable , such as :

- (a) the convergent panels in austenitic alloy, which form the convergent section of the secondary nozzle,
- (b) the divergent panels in austenitic alloy, which form the divergent section of the secondary nozzle.

- (c) the shields, in stainless-steel honeycomb sheet, which provide thermal protection for the rear-end frame-work of the secondary nozzle when in "reverse thrust" configuration ;
  - (d) the fairings, in stainless-steel honeycomb sheet, which form the extension of the side-walls,
  - (e) the access doors to the various elements of the bucket actuator system, which are located as follows :
    - 1) at the top,
      - at the front, two central doors giving access to the pneumatic motors,
      - at the rear, one central door giving access to the bucket central screw gear-boxes and to the bucket crossfeed isolation valve,
      - at the rear, two side doors giving access to the bucket side screw gear-boxes.
    - 2) at the bottom,
      - at the front, two central doors giving access to position indicators,
      - at the rear, one central door giving access to the bucket central screw gear-boxes,
      - at the rear, two side doors giving access to the bucket side screw gear-boxes.
  - (f) The covers blanking the twin secondary nozzle endoscope inspection holes. The position of these inspection holes is given in figure 4.
- (3) Description of items for fixing the primary nozzles and the buckets
- (a) Attachment of primary nozzles
- Each of the two primary nozzles is fixed to the twin secondary nozzle by 3 pins (see figure 5). These pins (1), in high-temperature alloy, fit, at one end, into housings integral with the secondary nozzle frame-work. The other end, covered with a sleeve, fits into the inner ring of a spherical bearing, fixed to the primary nozzle support ring. The pins are retained in the axial direction by the components:

78-13-01

Attachment of Primary Nozzles  
Figure 5

Bucket Attachment  
Figure 6

OLYMPUS 593

MK.610-14-28

OVERHAUL

cup-washer (2) spherical end stop (3) dogged washer (4) retained by keep plate (5). A cover (7) blanks the recesses containing the pins and locking system. On the upper and lower pins, the cover (7) is fitted with a spacer (6).

(b) Bucket attachment (see figure 6)

Each twin secondary nozzle is fitted with four buckets, each of which has two hinge points with the secondary system. These hinge points are situated at the rear of the central and side wall members of the twin secondary nozzle assembly. The mounting is effected by a plain bearing fitted into the inner ring of the spherical bearing in the bucket. The plain bearing includes pegs which prevent the inner ring from rotating. The risk of the plain bearing (1) becoming dislodged from their housings in the case of a failure of the shaft (2) lead to the introduction of a retaining device. This consists, basically, of a peg (3) for each plain bearing. The pegs (3) are fixed to the hinge bracket into which the plain bearings (1) are fitted, thus limiting their movement in the case of a failure of the shaft (2).

Austenitic alloy deflectors are fitted to the inside of the buckets. During reverse thrust, these deflectors resist the ingestion of hot gas into the interior of the secondary nozzle. In addition they protect the bucket hinge points on the twin secondary nozzle.

(4) Description of the operation of the primary nozzle area transducer harness.

(a) Description

Two harnesses (see figure 7) are fitted to the secondary nozzle, and are located symetrically about the assembly centre line. They are located in the lower forward part of the interior of the structure. One end of the cable exits in the forward part of the central wall, and is fixed by two bolts with a plate (1) and a bar. This end constitutes the harness frontier with the nacelle. The other end is attached to the nozzle area transducer fitted to the primary nozzle. The free section of the harness is supported by two half clamps (2) fixed to the bay wall.

OVERHAUL

The nozzle area transducer harness is itself composed of :

- 1) a screened four-cored cable (3) with thermal-setting sleeves placed close to the connector at the ends of the screening,
- 2) a receptacle (4) with four pins,
- 3) a movable four pin socket connector (5),
- 4) a protective sheath comprising a flexible sleeve (6) in stainless steel brazed to the movable connector,
- 5) identify sleeves for each wire, yellow in colour and marked A, B, C, D respectively.

(b) Operation

See layout on figure 7

(5) Description of accessory attachment parts

(a) Attachment of bucket pneumatic drive motors (figure 8)

The bucket actuator drive motors (1) are located in the upper forward part of the twin secondary nozzle ; access is via the central doors. The motors are fixed to the structures at three points :

- two rigid motor-to-structure mounting points (2),
- one adjustable motor-structure mounting by means of tie-rod (3).

The P3 air feed for each bucket motor is effected by a tube which crosses the forward bulk head of the central wall, to which it is secured by a nut (5). The other end of the tube is fixed to a bracket (6) inside the bucket actuator motor housing. Two covers (7) blank the tube (4) passage in the base of the housing. The connection between tube (4) and tube (8) mounted on the motor, is effected by a telescopic tube (9), thus ensuring continuity of flow without imposing mechanical loads on the connection points. An exhaust duct (10) fixed to each motor, passes through the access door and allows exhaust air to escape to the outside of the structure.

(b) Attachment of the nozzle ball-screw gear-boxes, and bucket position transmitters (indicators) (see figure 9).

Transmitter (Indicator)  
Figure 9

OLYMPUS 593

MK.610-14-28

OVERHAUL

1) Attachment of bucket ball-screw gear-boxes

There are eight ball-screw gear-boxes (1) per twin secondary nozzle ; i.e two gear-boxes to move each bucket. The end fitting (2) of the gear-box fits into a yoke on the bucket. The other end (i.e reduction gear-box end) carries a yoke (3) which is fixed by a shaft, to a bracket (4) which is rigidly mounted on the secondary nozzle. The bracket (4) carries a peg which fits into the gear-box yoke (3) and which, with anti-rotation bracket (5), engaged into the bucket yoke, resists any reaction torque resulting from the operation of the nut/screw system.

The hinge between the bracket (4) and the yoke (3) includes a spherical bearing crimped into the bracket.

2) Attachment of the bucket position transmitter (indicator).

Two bucket position transmitters (indicators) per twin secondary nozzle are fitted. They are located in the lower, forward part of the structure.

The position transmitters (indicators) (1) are three-point mounted by two removable supports (2) and a fixed support (6). The transmitter (indicator) trunnions (4) fit into spherical bearings (3), attached to these supports.

(c) Attachment of bucket crossfeed isolation valve (figure 10).

The isolation valve (1) is located in the upper central part of the secondary nozzle. It is mounted on a bracket which pivots on a flanged shaft (3) rigidly mounted on the secondary nozzle structure. The isolation valve is fitted into the tube connecting the two P3 air feeds to the bucket motors. This tube is supported :

- by a double clamp (4) fixed to the bulkhead of the bucket motor housing,
- by a tie-rod (5) hinged to a yoke fitted to the structure,

(d) Attachment of electrical harness

On each secondary nozzle are fitted two electrical harnesses which connect the various accessories fitted to the nozzle. These harnesses comprise :

78-13-01

Attachment of the Bucket  
Cross-feed Isolation Valve  
Figure 10

OLYMPUS 593

MK.610-14-28

OVERHAUL

junction box fixed inside the bucket motor housings. From this junction box, two looms go :

- one to the bucket motor,
- the other to the bucket position transmitter (indicator). The looms are supported by clips and are lead through the structure inside a metal tube fixed to the structure. The outlet connectors from the junction boxes form the harness frontier between the secondary nozzle and the nacelle.

NOTE : The electrical harnesses for bays 2 and 4 include a third loom for the isolation valve.

### 3. Description of the bucket actuator system

Refer to the following chapters :

- 78-13-10 for electrical harnesses,
- 78-31-01 for the buckets,
- 78-31-12 for the telescopic tube,
- 78-32-19 for the bucket ball-screw gear-boxes,
- 78-33-06 for the bucket motors,
- 78-34-01 for the bucket flexible shafts,
- 78-35-01 for the bucket position transmitter (indicator),
- 78-37-01 for the isolation valve.

### 4. Operation of the twin secondary nozzle assembly

As stated in the previous pages, the twin secondary nozzle assembly embodies the basic twin secondary nozzle, the reverse buckets and part of the whole reverse bucket control system. In order to facilitate comprehension of operation we suggest, although the following is beyond the scope of this manual, to offer the reader a short description of the whole control system.

#### A. Composition of the reverse bucket control system.

This system embodies electro-pneumatic pieces of equipment the logic diagram of which is shown on Figure 11.

**78-13-01**

Page 18  
Dec 15/75

OLYMPUS 593

MK.610-14-28

OVERHAUL

These equipment are the following :

(1) The reverse command system

This system is remotely installed and is thereby not part of the twin secondary nozzle assembly. It is composed of :

- (a) The A.D.C. (Air Data Computer) which delivers an electrical signal proportional to the aircraft Mach number.
- (b) The N.A.S.U. (Nozzle Angle Scheduling Unit) which generates a signal  $S_1 = f(\text{Mach})$  versus the pre-selected modulation law (Ref. to Fig. 12).
- (c) The N.T.R.C. (Nozzle and Thrust Reverser Controller) which compares the feedback signal proportional to the position of the buckets, with the thrust reverse command signal  $S_1$ . It amplifies the error signal to command the bucket pneumatic drive actuator operation.

(2) The reverse actuating system

This system is part of the twin secondary nozzle assembly. It is composed of :

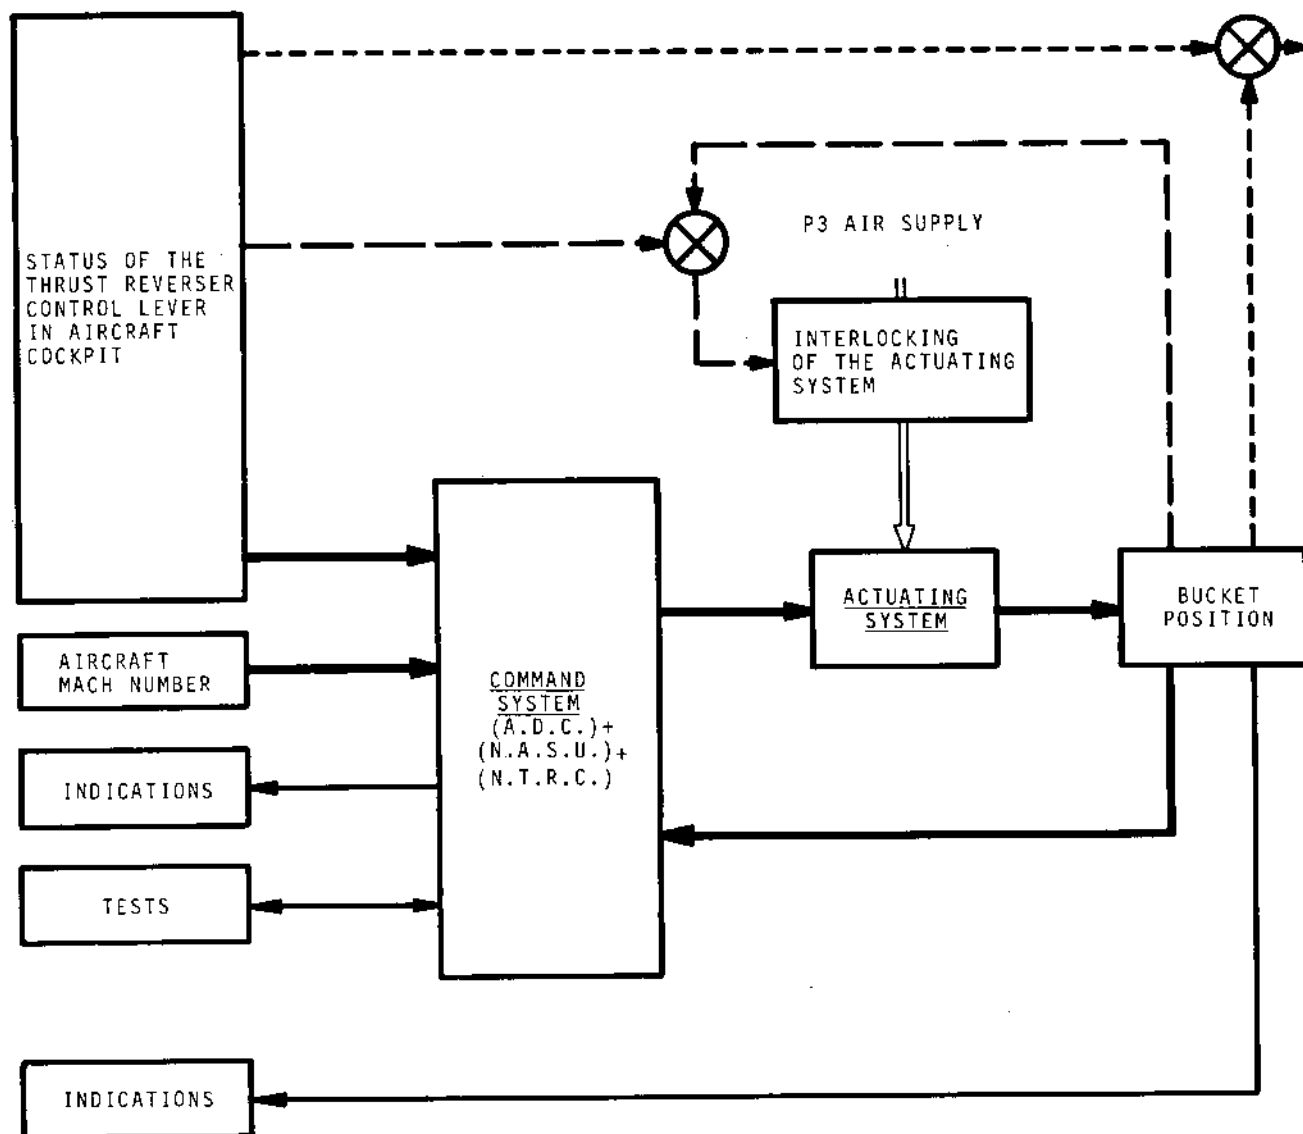

- (a) The bucket pneumatic drive actuator which itself, incorporates :
  - an air motor
  - an electro-magnetic control valve which supplies a pneumatic signal as a function of the error signal.
  - an L.V.D.T. (Linear Variable Differential Transformer) which, from a duplication of the pneumatic drive actuator position, provides a feedback electrical signal to the N.T.R.C.
  - various pneumatic servo-control systems.
- (b) The flexible shafts which transfer the air motor power output to the bucket ballscrew gear-boxes.
- (c) The ballscrew gear-boxes which actuate the buckets.

OVERHAUL

- (d) The bucket position transmitter (indicator), integrated in the transmission train, which sends signals about the bucket positions to provide for the indication and safety functions.
- (e) The bucket crossfeed isolation valve which allows in-flight thrust reverse on the two inboard engines.

## B. Operation

The twin secondary nozzle assembly and the bucket control system provide for :

- Specific, major functions :
    - Modulation of the twin nozzle exhaust area
    - Thrust reverse operation
  - Secondary safety functions :
    - Automatic return of engine to idle power setting (wind-down)
    - Limitation of the bucket travel
  - Indication functions for the flight crew information
- (1) Modulation of the twin nozzle exhaust gas area.

To optimize the powerplant performance, the twin nozzle exhaust area is modulated versus the aircraft Mach number. The pre-selected law, evolving from in-flight tests data, is shown on Figure 12.

The buckets, which govern the exhaust gas area, are servo-controlled in position by a regulation loop comprising the N.T.R.C. and the bucket pneumatic drive actuator.

At any time, the N.T.R.C. compares the actual bucket position with the command signal delivered by the N.A.S.U. The resulting error signal, if any, commands the pneumatic drive actuator to operate, thus causing the buckets to move towards the required direction (Figure 13) by means of the flexible shafts and of the bucket ballscrew gear-boxes.

### (2) Thrust reverse

Engine thrust reverse is applied on ground during the

**78-13-01**

Page 22  
Dec 15/75

OLYMPUS 593

MK.610-14-28  
OVERHAUL

aircraft landing roll or in case of aborted take-off in order to assist the aircraft braking; it is also used in flight to ensure a sufficient aircraft descent rate during the subsonic deceleration phase. In the two cases, the buckets are positioned at 73 deg. thus blocking the free passage for the exhaust jet while enabling the obtention of a negative thrust (Refer to Fig. 13).

(a) On-ground thrust reverse mode

During the phase where the thrust reverse is operating, the bucket pneumatic drive actuator is controlled in open loop configuration. The reverse command signal, emanating from the relevant reverse lever, opens the regulation loop. The pneumatic drive actuator electro-magnetic control valve is then electrically supplied with a constant control current which is cause for the bucket actuation towards the 73 deg. angular position.

(b) In-flight thrust reverse mode : pneumatic cross-feed system.

In-flight thrust reverse, used to increase the aircraft descent rate, is applied on the two aircraft inboard engines only. At high altitude and with the engines at idle power, the air bleed pressure available from the HP compressor of the engines, taken individually, is marginal to ensure a suitable deployment of the buckets in the exhaust stream. Consequently, in order to obtain a higher pneumatic pressure, the actuating systems of the inboard bay's buckets are - during the buckets transit period - supplied via the crossfeed isolation valve by HP bleed air from the adjacent engine, the idle power of which is set at a higher level for the whole duration of the reverse sequence. The pneumatic crossfeed system is illustrated by the diagram of Figure 14.

(3) Automatic return to idle power (wind-down)

The engine power rating is automatically re-set to idle in the two following occurrences :

- Movement of the buckets beyond 45 deg. without having the thrust reverse selected beforehand.

78-13-01

Page 23  
Dec 15/75

OLYMPUS 593

MK.610-14-28

OVERHAUL

- Movement of the buckets within 71 deg. when the reversed jet position is selected.

This function is achieved by means of micro-switches the operating state of which is slaved to the bucket position (bucket position transmitter (indicator)) and to the pilot's throttle lever configuration.

The resulting signal is then sent to the basic engine control amplifiers which in turn, govern the engine rotational speed.

(4) Interlocking of the bucket actuating system

A shut-off valve located on the bucket pneumatic drive actuator air inlet system cuts the air feed should an unwanted transit of the buckets beyond 27 deg. occurs notwithstanding the non-selection of the thrust reverse; the buckets are then interlocked in a position slightly higher than 27 deg.

(5) Indications

Some of the analogic and/or logic indications are conveyed back to the aircraft cockpit or to the 3rd crew member station and allow to visually check for nominal operation of the whole system.

## DISASSEMBLY

### 1. General

- A. During disassembly, follow the general recommendations given in chapter 70-05-00 of the Standard Practices manual, and the working procedures section of the Overhaul Manual.
- B. Use only tools and special equipment nominated in the disassembly procedures, and identified by a number SC.. of which an illustration is shown in the Special Tools and Equipment chapter.
- C. During disassembly, visually inspect all parts removed and report, to the Inspection Department, any defects found which could be obliterated by cleaning (scratches, burning) and which may result from incorrect operation. Also report any broken parts or missing locking devices.
- D. In the working procedures section of the manual, parts are referenced to the I.P.L. by two numbers in brackets, the first of which is the figure number in the I.P.L. on which the part is shown, and the second number is the item number within that figure.

### 2. Removal of Seal Plates and Anti-Fret Strips from the Front Framework

NOTE : These disassembly operations must be carried out when the secondary nozzle is on the transport trolley - tool SC 36 - in order to avoid damaging the seals during positioning on the rotating stand.

- A. Removal of the seals around the front framework of bay 1 or bay 3.
  - (1) Removal of LH seal plate (10-20)
    - (a) Unscrew nuts (10-12)  
Remove washers (10-15) and screws (10-17).
    - (b) Unscrew nuts (10-5). Remove countersunk head screws (10-10) and remove seal plate (10-20) for bay 1 or (10-21) in the case of bay 3.
  - (2) Unscrew nuts (10-25), withdraw countersunk head screws (10-30) and remove LH seal plate assembly (10-40) for bay 1 or (10-41) for bay 3.

78-13-01

OVERHAUL

- (3) Unscrew nuts (10-45), withdraw countersunk head screws (10-50) and remove LH seal plate assembly (10-60) for bay 1 or (10-61) for bay 3.
- (4) Unscrew nuts (10-65), withdraw countersunk head screws (10-70) and remove LH seal plate assembly (10-80) for bay 1 or (10-81) for bay 3.
- (5) Unscrew nuts (10-85), withdraw countersunk head screws (10-90) and remove LH seal plate assembly (10-100) for bay 1 or (10-101) for bay 3.
- (6) Unscrew nuts (10-105), withdraw countersunk head screws (10-110) and remove LH seal plate assembly (10-120) for bay 1 or (10-121) for bay 3.
- (7) Unscrew nuts (10-125), withdraw countersunk head screws (10-130) and remove LH seal plate assembly (10-140) for bay 1 or (10-141) for bay 3.
- (8) Unscrew nuts (10-145), withdraw countersunk head screws (10-150) and remove LH seal plate assembly (10-160) for bay 1 or (10-161) for bay 3.
- (9) Unscrew nuts (10-165), withdraw countersunk head screws (10-170) and remove LH seal plate assembly (10-180) for bay 1 or (10-181) for bay 3.
- (10) Unscrew nuts (10-185), withdraw countersunk head screws (10-190) and remove LH seal plate assembly (10-200) for bay 1 or (10-201) for bay 3.
- (11) Unscrew nuts (10-205), withdraw countersunk head screws (10-210) and remove LH seal plate assembly (10-220) for bay 1 or (10-221) for bay 3.
- (12) Unscrew nuts (10-225), withdraw countersunk head screws (10-230) and remove seal plate (10-240).

B. Removal of Seal Plate Assemblies around the Front Framework of Bay 2 or Bay 4.

- (1) Removal of seal plate assembly (10-260)
  - (a) Unscrew nuts (10-252), withdraw washers (10-255) and screws (10-257)
  - (b) Unscrew nuts (10-245), withdraw countersunk head screws (10-250) and remove the LH seal plate assembly (10-260) for bay 2 or RH seal plate assembly (10-261) for bay 4.

- (2) Unscrew nuts (10-265), withdraw countersunk head screws (10-270) and remove the LH seal plate assembly (10-280) for bay 2 or (10-281) for bay 4.
- (3) Unscrew nuts (10-285), withdraw countersunk head screws (10-290) and remove the LH seal plate assembly (10-300) for bay 2 or (10-301) for bay 4.
- (4) Unscrew nuts (10-305), withdraw countersunk head screws (10-310) and remove the LH seal plate assembly (10-320) for bay 2 or (10-321) for bay 4.
- (5) Unscrew nuts (10-325), withdraw countersunk head screws (10-330) and remove the LH seal plate assembly (10-340) for bay 2 or (10-341) for bay 4.
- (6) Unscrew nuts (10-345), withdraw countersunk head screws (10-350) and remove the LH seal plate assembly (10-360) for bay 2 or (10-361) for bay 4.
- (7) Unscrew nuts (10-365), withdraw countersunk head screws (10-370) and remove the LH seal plate assembly (10-380) for bay 2 or (10-381) for bay 4.
- (8) Unscrew nuts (10-385), withdraw countersunk head screws (10-390) and remove the LH seal plate assembly (10-400) for bay 2 or (10-401) for bay 4.
- (9) Unscrew nuts (10-405), withdraw countersunk head screws (10-410) and remove the LH seal plate assembly (10-420) for bay 2 or (10-421) for bay 4.
- (10) Unscrew nuts (10-425), withdraw countersunk head screws (10-430) and remove the LH seal plate assembly (10-440) for bay 2 or (10-441) for bay 4.
- (11) Unscrew nuts (10-445), withdraw countersunk head screws (10-450) and remove the LH seal plate assembly (10-460) for bay 2 or (10-461) for bay 4.
- (12) Unscrew nuts (10-465), withdraw countersunk head screws (10-470) and remove the LH seal plate assembly (10-480).

C. Removal of Anti-fret Strips from the Central Wall

- (1) Unscrew blind bolts (10-500), withdraw throat washer (10-510) and remove anti-fret strips (10-520) and (10-530).

78-13-01

Page 103

May 31/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Unscrew blind bolts (10-540), withdraw throat washer (10-550) and remove anti-fret strips (10-560) and (10-570).
- (3) Unscrew blind bolts (10-580), withdraw throat washer (10-590) and remove anti-fret strips (10-600) and (10-610).
- (4) Unscrew blind bolts (10-620), withdraw throat washer (10-630) and remove anti-fret strips (10-640) and (10-650).
- (5) Unscrew self-locking nuts (10-660) and remove washers (10-670).
- (6) Withdraw bolts (10-680) and remove anti-fret strips (10-690) and (10-700).

D. Removal of Threaded Pins (10-490)

- (1) Unlock pins (10-490).
- (2) Unscrew and remove the pins.

E. Removal of Trunnions

Carry out the following operations for each trunnion.

- (1) Unscrew self-locking nut (20-70), remove plain washer (20-80) and screw (20-90)
- (2) Unscrew self-locking nut (20-100), remove plain washer (20-110) and bolt (20-120) complete with washer (20-130).
- (3) Collect laminated shim (20-140) and remove the support (20-150) complete with the trunnion (20-155).
- (4) Remove the trunnion assembly (20-155) from the support and separate the spring pins (20-160) from the trunnion (20-170).

3. Preparation for Disassembly

A. Fitting the Twin Secondary Nozzle to the Rotating Stand - tool SC 117.

- (1) Using a hoist, fit the hoisting "T" beam - tool SC 195 - to the nozzle, which is on the trolley - tool SC 36.

PRINTED IN FRANCE

78-13-01

Page 104  
May 31/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Attach the three slings of the hoisting "T" beam to the lifting point located on the upper forward section and on the side walls.
- (3) Unlock the secondary nozzle from the trolley - tool SC 36.
- (4) Operate the hoist to remove the nozzle from the trolley, and position the latter on the rotating stand - tool SC 117.
- (5) Fit the tooling ring at the attachment and mounting pin points.
- (6) Remove the lifting beam - tool SC 195.

#### 4. Removal of Access Doors (Left Hand Twin Secondary Nozzle)

NOTE : Remove doors (3-10) and (3-170) while the nozzle is still in its container, so as to allow fitting of the upper handling support - tool SC 194.

##### A. Removal of Access Door (3-10)

- (1) Remove countersunk head screws (3-20) and (3-25).
- (2) Remove LH access door assembly (3-10) which gives access to the bay 1 bucket pneumatic drive actuator housing.
- (3) Disassembly of left hand access door assembly (3-10).
  - (a) Unscrew self-locking nuts (3-30) and remove washers (3-40).
  - (b) Remove countersunk head screws (3-50), the LH sleeve support plate (3-60), the LH sleeve assembly (3-70) and the LH sleeve support (3-80).
  - (c) Unscrew self-locking nuts (3-90) and remove plain washers (3-100).
  - (d) Remove countersunk head screws (3-110), the LH sleeve support plate (3-120), the LH sleeve assembly (3-130) and the LH sleeve support (3-140).

##### B. Removal of the LH Access Door (3-170)

- (1) Remove countersunk head screws (3-180) and (3-185).
- (2) Remove LH access door (3-170) which gives access to the bay 2 bucket drive pneumatic actuator housing.

**78-13-01**

OLYMPUS 593

MK.610-14-28  
OVERHAUL

C. Removal of LH Access Door (3-330)

- (1) Remove countersunk head screws (3-340).
- (2) Remove the LH access door (3-330) which gives access to the crossfeed isolation valve and the upper central ballscrew gearboxes.

D. Removal of LH Access Door (3-350)

- (1) Remove countersunk head screws (3-360).
- (2) Remove LH access door (3-350) which gives access to the upper LH ballscrew gearbox for bay 1.

E. Removal of LH Access Door (3-370)

- (1) Remove countersunk head screws (3-380)
- (2) Remove LH access door (3-370) which gives access to the bay 2 upper RH ballscrew gearbox housing.

F. Removal of RH Access Doors (3-390)

For each access door, carry out the following operations :

- (1) Remove countersunk head screws (3-410).
- (2) Remove the RH access door assembly (3-390).
- (3) Dissassembly of RH access door (3-390)
  - (a) Remove split pin (3-400).
  - (b) Remove countersunk head screws (3-410) and withdraw nut plate assembly (3-420).

G. Removal of RH Cover Plates (3-440)

For each cover plate, carry out the following operations :

- (1) Unscrew countersunk head screws (3-460).
- (2) Remove the RH cover plate assembly (3-440).
- (3) Disassemble the cover plate (3-440).
  - (a) Withdraw split pin (3-450).
  - (b) Remove countersunk head screws (3-460) and withdraw the nut plate assembly (3-470).

H. Removal of Access Door (4-10)

- (1) Remove countersunk head screws (4-20).
- (2) Remove the access door (4-10) which gives access to the lower central ballscrew gearboxes.

J. Removal of LH Access Door (4-30)

- (1) Remove countersunk head screws (4-40).
- (2) Remove LH access door (4-30) which gives access to the bay 3 lower LH ballscrew gearbox.

K. Removal of LH Access Door (4-50)

- (1) Remove countersunk head screws (4-60).
- (2) Remove LH access door (4-50) which gives access to the bay 4 lower RH ballscrew gearbox.

L. Removal of LH Access Door (4-70)

- (1) Remove countersunk head screws (4-80)
- (2) Remove LH access door (4-70) which gives access to the bay 4 bucket position indicator.
- (3) Remove the threaded plug (4-90).

M. Removal of LH Access Door (4-100)

- (1) Remove countersunk head screws (4-110).
- (2) Remove the LH access door (4-100) which gives access to the bay 1 bucket position indicator.
- (3) Remove threaded plug (4-120).

5. Removal of Access Doors (RH Twin Secondary Nozzle Assembly)

NOTE : Remove RH access doors (3-150) and (3-190) while the nozzle is still in its container, so as to allow fitting of the upper handling support - tool SC 194.

A. Removal of RH Access Door (3-150)

- (1) Unscrew countersunk head screws (3-160).
- (2) Remove the RH access door (3-150) which gives access to the bay 4 bucket pneumatic drive actuator housing.

B. Removal of RH Access Door (3-190)

- (1) Remove countersunk head screws (3-200).
- (2) Remove RH access door assembly (3-190), which gives access to the bay 3 bucket pneumatic drive actuator.
- (3) Disassembly of access door (3-190).
  - (a) Unscrew self-locking nuts (3-210) and plain washers (3-220).
  - (b) Remove countersunk head screws (3-230), the RH sleeve support (3-240), the RH sleeve assembly (3-250) and the RH sleeve support (3-260).
  - (c) Unscrew self-locking nuts (3-270) and remove plain washers (3-280).
  - (d) Remove countersunk head screws (3-290), the RH sleeve support (3-300), the RH sleeve assembly (3-310) and the RH sleeve support (3-320).

C. Removal of RH Access Door (3-331)

- (1) Unscrew countersunk head screws (3-340)
- (2) Remove access door (3-331) which gives access to the crossfeed isolating valve and the upper central ball-screw gearboxes.

D. Removal of RH Access Door (3-351)

- (1) Remove countersunk head screws (3-360).
- (2) Remove access door (3-351) which gives access to the bay 4 upper RH ballscrew gearbox housing.

E. Removal of RH Access Door (3-371)

- (1) Unscrew countersunk head screws (3-380).
- (2) Remove access door (3-371) which gives access to the bay 3 upper LH ballscrew gearbox housing.

F. Removal of RH Access Door Assemblies (3-390)

- (1) Repeat the operations given in paragraph 4.F.

G. Removal of RH Cover Plate Assemblies (3-440)

- (1) Repeat the operations given in paragraph 4.G.

H. Removal of Access Door (4-10)

- (1) Repeat the operations given in paragraph 4.H.

J. Removal of RH Access Door (4-31)

- (1) Remove countersunk head screws (4-40).
- (2) Remove access door (4-31) which gives access to the bay 4 lower RH ballscrew gearbox.

K. Removal of RH Access Door (4-51)

- (1) Remove countersunk head screws (4-60).
- (2) Remove access door (4-51) which gives access to the bay 3 lower LH ballscrew gearbox.

L. Removal of LH Access Door (4-71)

- (1) Remove countersunk head screws (4-80).
- (2) Remove access door (4-71) which gives access to the bay 3 bucket position indicator.
- (3) Remove threaded plug (4-90).

M. Removal of RH Access Door (4-101)

- (1) Remove countersunk head screws (4-110)
- (2) Remove access door (4-101) which gives access to the bay 4 bucket position indicator.
- (3) Remove threaded plug (4-120).

6. Removal of the Deflector Assembly

NOTE : Do not mix the attachment parts. As disassembly progresses, arrange them on the templates - tool SC 200.

OVERHAUL

A. Removal of Deflector Assemblies (1-10)

For each deflector assembly, carry out the following operations :

- (1) Remove hex. head bolts (1-110), (1-120), (1-130).
- (2) Remove hex. head bolts (1-180) and collect plain washers (1-190).
- (3) Remove hex. head bolts (1-140) and collect plain washers (1-150).
- (4) Remove hex. head bolt (1-160) and collect plain washers (1-170).
- (5) Unscrew self-locking nut (1-40), withdraw hex. head bolt (1-20) and collect plain washers (1-50) and (1-30).
- (6) Remove hex. head bolt (1-60) and collect plain washer (1-70).
- (7) Remove hex. head bolt (1-80) and collect plain washer (1-90).
- (8) Remove cover strip (1-100) and deflector assembly (1-10).

B. Removal of Deflector Assemblies (1-200)

For each deflector assembly, carry out the following operations :

- (1) Remove hex. head bolts (1-300), (1-310), (1-320).
- (2) Remove hex. head bolts (1-370) and collect plain washers (1-380).
- (3) Remove hex. head bolts (1-330) and collect plain washers (1-340).
- (4) Unscrew hex. head bolt (1-350) and collect the plain washer (1-360).
- (5) Unscrew self-locking nut (1-230), withdraw hex. head bolt (1-210) and collect plain washers (1-240) and (1-220).
- (6) Remove hex. head bolt (1-250) and collect the plain washer (1-260).

MK.610-14-28

OVERHAUL

- (7) Remove hex. head bolt (1-270) and collect the plain washer (1-280).
- (8) Remove the cover strip (1-290) and the deflector assembly (1-200).

## 7. Removal of Reverser Bucket Assemblies

### A. Removal of the Locking Pads for the Safety Pins.

- (1) Withdraw the locking wire from hex. head bolts (2-110).
- (2) Unscrew bolts (2-110).
- (3) Withdraw split pin (2-80).
- (4) Unscrew the castellated nut (2-90) and collect the plain washer (2-100).
- (5) Remove the locking pads (2-120).

### B. Removal of the Bay 1 Upper Reverser Bucket.

- (1) Using a hoist, position the hoisting beam - tool SC 205 - and fix it to the bucket.
- (2) Operate the hoist so that it just takes the weight of the bucket.
- (3) Separate the bucket from the ballscrew gearboxes by carrying out the following operations at each attachment point :
  - (a) Withdraw split pin (2-390) and unscrew the castellated nut (2-400).
  - (b) Withdraw the ballscrew gearbox attachment bolt (2-420) and collect plain washers (2-410) and (2-430).
- (4) Removal of the trunnion bearing attachment bolt (2-250) on the side wall.
  - (a) Using special spanner - tool SC 254 - unscrew the locknut (2-210) and withdraw the anti-rotation sleeve (2-220).
  - (b) Using special spanner - tool SC 254 - unscrew self-locking nut (2-230) and withdraw the trunnion attachment bolt washer (2-240)

OVERHAUL

- (c) Withdraw the trunnion bearing attachment bolt (2-250).
  - (5) Removal of the trunnion attachment bolt (2-60) from the central wall.
    - (a) Using special spanner - tool SC 254 - unscrew the locknut (2-20) and withdraw the anti-rotation sleeve (2-30).
    - (b) Using special spanner - tool SC 254 - unscrew self-locking nut (2-40) and withdraw the trunnion attachment bolt washer (2-50).
    - (c) Withdraw the trunnion attachment bolt (2-60) and collect the trunnion attachment bolt washer (2-70)
  - (6) Withdraw the safety pin (2-130) which retains the bucket trunnion bearing (2-170).
  - (7) Remove the trunnion bucket bearings (2-260) and (2-170) using the extractor - tool SC 209 -
  - (8) Operate the hoist to remove the complete reverser bucket assembly (2-10) from the structure. Position it on the workstand - tool SC 37 -
  - (9) Secure the reverser bucket to the workstand and remove the hoisting beam.
- C. Removal of the Bay 1 Reverser Bucket Assembly
- (1) Using a hoist, position the hoisting beam - tool SC 205- and attach it to the bucket.
  - (2) Operate the hoist so that it just takes the weight of the bucket.
  - (3) Separate the reverser bucket from the ballscrew gearboxes by carrying out the following operations at each attachment point :
    - (a) Withdraw split pin (2-390) and unscrew castellated nut (2-400).
    - (b) Withdraw the ballscrew gearbox attachment bolt (2-420) and collect plain washers (2-410) and (2-430).
  - (4) Removal of the trunnion bearing attachment bolt (2-340) from the side wall.

  - (a) Using the special spanner - tool SC 254 - unscrew the locknut (2-300) and withdraw the anti-rotation sleeve (2-310).
  - (b) Using the special spanner - tool SC 254 - unscrew the self-locking nut (2-320) and withdraw the trunnion attachment bolt washer (2-330).
  - (c) Withdraw the trunnion attachment bolt washer (2-340).
- (5) Withdraw the safety pin (2-130) which retains the trunnion bucket bearing (2-160), the double ended bolt (2-140) and the adjusting shim (2-150).
- (6) Remove the trunnion bucket bearings (2-160) and (2-350), using the extractor - tool SC 209 -
- (7) Operate the hoist to remove the complete reverser bucket assembly (2-10) from the structure and position it on the workstand - tool SC 37 -
- (8) Secure the bucket assembly to the waiting stand and remove the lifting beam.

E. Removal of the Bay 2 Lower Reverser Bucket Assembly

- (1) Using a hoist, position the hoisting beam - tool SC 205 - and fix it to the bucket.
- (2) Operate the hoist to just take the weight of the bucket.
- (3) Separate the reverser bucket from the ballscrew gearboxes by carrying out the following operations at each attachment point.
  - (a) Withdraw the split pin (2-390) and unscrew the castellated nut (2-400).
  - (b) Withdraw the ballscrew gearbox attachment bolt (2-420) and collect the plain washers (2-410) and (2-430).
- (4) Removal of trunnion bearing attachment bolt (2-250) on the side wall :

- (a) Using the special spanner - tool SC 254 - unscrew locknut (2-210) and withdraw the anti-rotation sleeve (2-220).
  - (b) Using the special spanner - tool SC 254 - unscrew the self-locking nut (2-230) and withdraw the trunnion attachment bolt washer (2-240).
  - (c) Withdraw the trunnion bearing attachment bolt (2-250).
- (5) Withdraw the safety pin (2-130) which retains the bucket trunnion bearing (2-170), the double-ended bolt (2-140) and the adjusting shim (2-150).
  - (6) Remove the bucket trunnion bearings (2-260) and (2-170) using extractor - tool SC 209 -
  - (7) Operate the hoist to remove the complete reverser bucket assembly (2-10) from the structure and position it on the workstand - tool SC 37 -
  - (8) Fix the bucket assembly to the rotating stand and remove the hoisting beam.

#### F. Removal of the Trunnion Locking Pins

- (1) Carry out the following operations to remove the trunnion locking pins at the upper side attachment points.
  - (a) Withdraw the lockwire from trunnion locking pins (2-380).
  - (b) Unscrew hex. nuts (2-360) and collect plain washers (2-370).
  - (c) Withdraw the trunnion locking pins (2-380).
- (2) Carry out the following operations to remove the trunnion locking pins from the lower side attachment points.
  - (a) Withdraw the lockwire from trunnion locking pins (2-290).
  - (b) Unscrew hex. nuts (2-270) and collect plain washers (2-280).
  - (c) Withdraw the trunnion locking pins (2-290).

OVERHAUL

- (3) Carry out the following operations to remove the trunnion locking pins from the central attachment points :

- (a) Withdraw the lockwire from the trunnion locking pins (2-200).
- (b) Unscrew hex. nuts (2-180) and collect plain washers (2-190).
- (c) Withdraw the trunnion locking pins (2-200).

8. Removal of the Bucket Drive Pneumatic Actuators

- A. Operate the Rotating Stand - tool SC 117 - to Position the Twin Secondary Nozzle Assembly Central Line Vertically.
- B. Uncoupling the Flexible Shafts from the Pneumatic Drive Actuators.

- (1) Uncoupling the flexible shafts from the bay 1 bucket pneumatic drive actuators.

- (a) Unscrew bolts (15-12) or (15-13) or (15-14) which retain the open flange of flexible shaft (15-10) to the pneumatic actuator, and remove the open flange.
- (b) Disengage the hexagon of flexible shaft (15-10) from its housing and, if applicable, collect shim (15-15) or (15-16).
- (c) Position the support - tool SC 187 - to the end of the flexible shaft.
- (d) Remove bolts (15-22) or (15-23) or (15-24) which secure the flexible shaft (15-20) flange to the pneumatic actuator.
- (e) Disengage the hexagon of flexible shaft (15-20) from its housing and, if applicable, collect shim (15-25) or (15-26).
- (f) Position the support - tool SC 187 - to the end of the flexible shaft.

- (2) Uncoupling the Flexible Shaft from the Bay 2 Bucket Drive Pneumatic Actuators.

- (a) Remove bolts (15-162) or (15-163) or (15-164) which retain the open flange of flexible shaft (15-160) to the pneumatic actuator, and remove the open flange.

OVERHAUL

- (b) Disengage the hexagon of flexible shaft (15-160) from its housing and, if applicable, recover shim (15-165) or (15-166).
  - (c) Position the support-tool SC 187 - to the end of the flexible shaft.
  - (d) Remove bolts (15-152) or (15-153) or (15-154) which retain the flexible shaft (15-150) flange to the pneumatic actuator.
  - (e) Disengage the hexagon of flexible shaft (15-150) from its housing and, if applicable, recover shim (15-155) or 15-156).
  - (f) Position the support-tool SC 187 - to the end of the flexible shaft.
- C. Removal of the Bay 1 Telescopic Tube (17-10)
- (1) Remove self-locking nut (17-20), withdraw hex. head bolt (17-30) and recover plain washer (17-40).
  - (2) Remove the retaining plate (17-50).
- D. Removal of Elbow Assembly (17-110)
- (1) Slacken and remove collar clamp (17-100) ; withdraw the elbow assembly (17-110) complete with the telescopic keep ring (17-90).
  - (2) Recover the sealing ring (17-120).
  - (3) Save the telescopic tube (17-10).
  - (4) Unscrew self-locking nut (17-60), withdraw the hex. head bolt (17-70) and recover the plain washer (17-80).
  - (5) Remove the telescopic keep ring (17-90) from the elbow assembly (17-110).
- E. Disconnect the Electrical Connectors
- (1) Remove the lockwire from each connector.
  - (2) Withdraw the electrical connectors from the pneumatic actuator receptacles.
- F. Removal of Bay 1 Bucket Pneumatic Drive Actuator.
- (1) Withdraw split pin (17-280), unscrew castellated nut (17-290) and recover the plain washer (17-300).

OLYMPUS 593

OVERHAUL

- (2) Withdraw the hex. head bolt (17-310) and the bushing (17-320).
- (3) Withdraw the split pin (17-330); unscrew the castella-  
ted nut (17-340).
- (4) Withdraw hex. head bolt (17-350) and collect plain  
washer (17-360).
- (5) Withdraw the split pin (19-220); unscrew castellated  
nut (19-230) and collect the plain washer (19-240).
- (6) Withdraw the hex. head bolt (19-250); withdraw the end  
of the rod assembly from the yoke on the structure and  
collect flanged bushings (19-390) and (19-400).
- (7) Disengage the pneumatic actuator from its mounting  
yokes and remove it from its housing.
- (8) Collect the flanged bushings (17-370) and (17-380).
- (9) Removal of the rod assembly :
- (a) Withdraw the split pin (17-240).
  - (b) Unscrew castellated nut (17-250) and collect  
plain washer (17-260).
  - (c) Withdraw hex. head bolts (17-270) and remove the  
rod assembly.
  - (d) Collect the flanged bushings (19-370) and  
(19-380).
- (10) Removal of the exhaust elbow assembly :
- (a) Slacken self-locking nuts (17-130).
  - (b) Unscrew self-locking nuts (17-130) and collect  
washers (17-140)
  - (c) Remove the exhaust elbow assembly (17-150) from  
the pneumatic actuator.
- (11) Remove the studs (17-220).
- (12) Fit blanks to the electrical connectors and the air  
inlet.
- G. Removal of the Bay 2 Pneumatic Actuator Exhaust Elbow  
Assembly (17-210)
- (1) Slacken the nuts (17-190)

- (5) Withdraw the split-pin (19-420); unscrew castellated nut (19-430) and remove plain washer (19-440).
  - (6) Remove the hex. head bolt (19-450); withdraw the end of the rod assembly from the yoke on the structure and collect the flanged bushings (19-510) and (19-520).
  - (7) Disengage the pneumatic actuator from the mounting yokes and remove it from its housing.
  - (8) Collect the flanged bushings (17-390) and (17-400).
  - (9) Removal of the rod assembly :
    - (a) Withdraw the split pin (17-240).
    - (b) Unscrew the castellated nut (17-250) and remove plain washer (17-260).
    - (c) Withdraw hex. head bolt (17-270) and remove the rod assembly.
    - (d) Collect the flanged bushings (19-490) and (19-500)
  - (10) Remove the studs (17-220).
  - (11) Fit blanks to the electrical connectors and the air inlet.
- M. Disassembly of Rod Assemblies (19-210) and (19-410).
- (1) Slacken the lock nut (19-270) and unscrew it; unscrew the rod end (19-260) from the fork end (19-280) and remove the lock nut.
  - (2) Slacken the lock nut (19-470) and unscrew it; unscrew the rod end (19-460) from the fork end (19-480) and remove the locknut (19-470).

9. Removal of Bucket Position Transmitters (Indicators)

A. Carry out the following operations for each transmitter :

- (1) Withdraw the lockwire from the electric cable connectors.
- (2) Disconnect the electrical connectors.
- (3) Remove the bolts (15-52) or (15-53) which retain the flexible shaft (15-50) flange to the position transmitter.

OVERHAUL

PRINTED IN FRANCE

- (4) Disengage the hexagon of the flexible shaft (15-50) from its housing and, if applicable, collect the spacer (15-54) or (15-55).
- (5) Position the support - tool SC 187 - to the end of the flexible shaft (15-50).
- (6) Remove hex. head bolts (16-80) and plain washers (16-90).
- (7) Remove the spherical bearing assemblies (16-110) and collect the mounts (16-100).
- (8) Disengage the position transmitter (indicator) (16-70) upwards and remove it from its housing.
- (9) Remove the hex. head bolts (16-140) and the plain washers (16-150).

NOTE : These assembly elements also retain the gutter weldment (28-278) which support the primary nozzle area transfuser harness. Care should be taken to leave the gutter attached to the harness.

- (10) Remove the spherical bearing assembly (16-160) and the shim (16-190).
- (11) Withdraw spherical bearings (16-120) and (16-170) from housings (16-130) and (16-180).
- (12) Fit blanks to the transmitter connectors.
- (13) Unscrew self-locking nuts (16-210).
- (14) Withdraw screws (16-200) and remove the welded bracket assembly (16-220).
- (15) Remove nuts (16-240).
- (16) Withdraw countersunk head screws (16-230) and remove the welded bracket assembly (16-250).

#### 10. Removal of Flexible Shafts

CAUTION : DURING REMOVAL, TAKE CARE NOT TO BEND THE FLEXIBLE SHAFTS.

OVERHAUL

A. Removal of Bay 1 Flexible Shaft (15-10)

- (1) Unscrew the nuts (15-17) which retain the flexible shaft flange to the bay 1 upper LH ballscrew gearbox.
- (2) Disengage the hexagon of the flexible shaft (15-10) from its housing and remove, if applicable, spacer (15-18) or (15-19).
- (3) Position the support - tool SC 187 - to the end of flexible shaft (15-10).

NOTE : The method of uncoupling the other end of the flexible shaft is described in paragraph 8.B.1.

- (4) Remove the flexible shaft (15-10).

B. Removal of Bay 1 Flexible Shaft (15-30)

- (1) Unscrew nuts (15-32) which retain the open flange of the flexible shaft (15-30) to the bay 1 upper LH ballscrew gearbox. Remove the open flange.
- (2) Disengage the hexagon of flexible shaft (15-30) from its housing and, if applicable, remove spacer (15-33) or (15-34).
- (3) Position the support - tool SC 187 - to the end of the flexible shaft (15-30).
- (4) Unscrew the nuts (15-35) which retain the flexible shaft (15-30) flange to the bay 1 lower LH ballscrew gearbox.
- (5) Disengage the hexagon of the flexible shaft (15-30) from its housing and, if applicable, remove the spacer (15-36) or (15-37).
- (6) Position the support - tool SC 187 - to the end of the flexible shaft (15-30).
- (7) Remove the flexible shaft (15-30).

C. Removal of the Bay 1 Flexible Shaft (15-50)

- (1) Unscrew nuts (15-56) which retain the open flange of the flexible shaft (15-50) to the lower bay 1 LH ballscrew gearbox, and remove the open flange.

- (2) Disengage the hexagon of flexible shaft (15-50) from its housing and, if applicable, remove spacer (15-57) or (15-58).

- (3) Position the cable support - tool SC 187 - to the end of the flexible shaft (15-50).

NOTE : The method of uncoupling the other end of the flexible shaft is described in paragraph 9.A.

- (4) Remove the flexible shaft (15-50).

D. Removal of Bay 1 Flexible Shaft (15-20)

- (1) Unscrew the nuts (15-27) which retain the flexible shaft(15-20)open flange to the bay 1 upper RH ball-screw gearbox , and remove the open flange.

- (2) Disengage the hexagon of flexible shaft (15-20) from its housing and remove, if applicable, spacer (15-28) or (15-29).

- (3) Position the cable support - tool SC 187 - to the end of flexible shaft (15-20).

NOTE : The method for uncoupling the other end of the flexible shaft is described in paragraph 8.B.1.

- (4) Remove the flexible shaft (15-20).

E. Removal of Bay 1 Flexible Shaft (15-40)

- (1) Unscrew the nuts (15-42) which retain the flange of the flexible shaft (15-40) to the bay 1 upper RH ball-screw gearbox.

- (2) Disengage the hexagon of flexible shaft (15-40) from its housing and, if applicable, remove spacer (15-43) or (15-44).

- (3) Position the cable support - tool SC 187 - to the end of flexible shaft (15-40).

- (4) Unscrew the nuts (15-45) which retain the open flange of flexible shaft (15-40) to the bay 1 lower RH ball-screw gearbox , and remove the open flange.

- (5) Disengage the hexagon of flexible shaft (15-40) from its housing and, if applicable, remove spacer (15-46) or (15-47).

OLYMPUS 593

OVERHAUL

## 11. Removal of Ballscrew Gearboxes

### A. Carry out the following operations for each ballscrew gearbox :

- (1) Withdraw split-pin (16-20); unscrew castellated nut (16-30) and remove plain washer (16-40).
- (2) Remove the ballscrew gearbox attachment bolt (16-50) and the plain washer (16-60).
- (3) Remove the ballscrew gearbox (16-10).
- (4) On the lower RH ballscrew gearboxes, unscrew the nuts and remove the blank (16-5).

## 12. Removal of the Cross-Feed Isolation Valve

### A. Removal of the Elbow Assemblies

- (1) Slacken and remove collar clamps (18-160) and (18-240)
- (2) Withdraw split-pin (18-20); unscrew castellated nut (18-30) and remove plain washer (18-40).
- (3) Withdraw the hex. head bolt (18-50) and remove washer (18-55).
- (4) Withdraw the lockwire from hex. nuts (18-120) and (18-200).
- (5) Unscrew hex. nuts (18-120) and (18-200).
- (6) Remove the spherical washers (18-130), (18-140), (18-210) and (18-220).
- (7) Remove dee head bolts (18-150) and (18-230).
- (8) Remove the elbow assemblies (18-190) and (18-110).
- (9) Remove sealing rings (18-170) and (18-250).
- (10) Remove the spherical bearing (18-180) from the elbow assembly (18-110).

### B. Removal of the Tube Assemblies

- (1) Unscrew hex. head bolt (18-320) and remove the half clamp assembly (18-330).

OVERHAUL

- (2) Unscrew self-locking nuts (18-480) and (18-390); remove plain washers (18-490) and (18-400).
- (3) Remove the hex. head bolts (18-410) and (18-500) and the washers (18-400) and (18-490).
- (4) Remove the P clips (18-420) and (18-510).
- (5) Unscrew self-locking nuts (18-520); remove plain washers (18-530).
- (6) Withdraw hex. head bolts (18-540) and remove the angle bracket (18-550).
- (7) Removal of the tube assembly (18-340). Carry out the following operations :
  - (a) Unlock and remove hex. nuts (18-350).
  - (b) Remove the spherical washers (18-360) and (18-370)
  - (c) Withdraw the dee head bolts (18-380) and remove the tube assembly (18-340).
- (8) Removal of tube assembly (18-430). Carry out the following operations :
  - (a) Unlock and remove hex. nuts (18-440).
  - (b) Remove the spherical washers (18-450) and (18-460)
  - (c) Withdraw the dee head bolts (18-470).
  - (d) Unscrew nut (18-472) and remove washer (18-474).
  - (e) Remove bolt (18-476) and the spherical washers (18-477) and (18-478).
  - (f) Remove the tube assembly (18-430).

#### C. Removal of the Cross-Feed Isolation Valve

- (1) Unlock and unscrew the electrical connectors.
- (2) Remove the cross-feed isolation valve (18-310) by disengaging it from its mounting pivot.
- (3) Unscrew bolts (18-260) and remove the valve support bracket (18-270).
- (4) Remove the spherical bearing (18-280) from the support bracket (18-270)
- (5) Fit blanks to the cross-feed isolation valve at the electrical plug and air inlet positions.

D. Removal of the Link Assembly and Mounting Yoke

- (1) Remove self-locking nuts (18-570) and plain washers (18-580).
- (2) Withdraw the hex. head bolts (18-590).
- (3) Withdraw bolt (18-593) and remove the mounting yoke complete with the link assembly. Collect the flanged bushings (18-600) and (18-610), along with the clip P (18-597).
- (4) Removal of the mounting link assembly :
  - (a) Withdraw the split-pin (18-20). Unscrew the castellated nut (18-30) and remove the plain washer (18-40).
  - (b) Withdraw the hex. head bolt (18-50), remove the link assembly and collect the flanged bushings (18-60) and (18-70).
- (5) Disassembly of the link assembly :
  - (a) Unlock the lock nut (18-90) and unscrew the rod end (18-80) from the rod end clevis (18-100).
  - (b) Remove the lock nut (18-90) from the rod end (18-80).

E. Removal of the Locating Pivot

- (1) Unscrew nut (26-220) and withdraw the bolt (26-230) which retains the electrical harness clip (18-655) to the bracket (18-670). Remove clip (18-655).
- (2) Unscrew self-locking nuts (18-630); remove plain washers (18-640).
- (3) Withdraw hex. head bolts (18-650); remove bracket (18-670) and the pivot (18-660).

13. Removal of the P3 Air Feed Tubes

A. Removal of Pipe Assembly (19-100)

- (1) Unscrew hex. head bolts (19-10); remove cover plates (19-20) and (19-30).
- (2) Unscrew pipe-end nut (19-40).

PRINTED IN FRANCE

OVERHAUL

PRINTED IN FRANCE

- (3) Unscrew hex. nut (19-50); remove the spacer washer (19-60).
- (4) Remove the hex.head bolt (19-70) and washer (19-80). Remove the pipe assembly (19-100).
- (5) Remove the blank (19-5).

B. Removal of Pipe Assembly (19-200)

- (1) Unscrew hex. head bolts (19-110); remove cover plates (19-120) and (19-130).
- (2) Unscrew pipe-end nut (19-140).
- (3) Unscrew hex. nut (19-150); remove the spacer washer (19-160).
- (4) Remove the hex. head bolt (19-170, and washer (19-180). Remove the pipe assembly (19-200).
- (5) Remove the blank (19-5).

14. Removal of Electrical Harnesses

NOTE : During disassembly, place the clips in a bag. These clips will accompany the harness during its overhaul cycle.

A. Removal of the Primary Nozzle Area Transducer Harness from Bay 1

- (1) Unscrew hex. head bolts (28-70) and remove plain washers (28-80).
- (2) Unscrew hex. nuts (28-50) and remove plain washers (28-60); withdraw bolts (28-40).
- (3) Remove the half-clamps (28-90).
- (4) Unscrew self-locking nut (28-110) and remove plain washer (18-120).
- (5) Remove either :
  - (a) Hex. head bolt (28-100) and clip C.
  - (b) Bolt (28-105), clip C and washer (28-115).
- (6) Unscrew self-locking nuts (28-140) and remove plain washers (28-150).

78-13-01

MK.610-14-28

OVERHAUL

- (7) Remove hex. head bolts (28-130) and clips D and K.
- (8) Unscrew self-locking nuts (28-170) and remove washers (28-180).
- (9) Remove round-head bolts (28-160) and clips E and F.
- (10) Unscrew self-locking nuts (28-200) and remove washers (28-210).
- (11) Remove hex. head bolts (28-190) and clips G and H.
- (12) Unscrew self-locking nut (28-230) and remove washer (28-240).
- (13) Withdraw bolt (28-220) and clip J.
- (14) Unscrew self-locking nut (28-260) and remove washer (28-270).
- (15) Withdraw hex. head bolt (28-250) and clip L.
- (16) Unscrew hex. head bolts (28-280) and remove washers (28-290).
- (17) Unlock and unscrew cylindrical head bolts (28-20); remove square spacers (28-30) and square plates (28-300).
- (18) Unscrew nut (28-273); remove washer (28-275) and bolt (28-272).
- (19) Remove the gutter unit (28-278) from the harness and remove the sheath (28-277).
- (20) Withdraw the primary nozzle area transducer harness from the structure.
- (21) Fit the blanking caps (30-30) and (30-140) to the harness connectors.

B. Removal of the Primary Nozzle Area Transducer Harness from Bay 2

- (1) Carry out the same operations as for the bay 1 harness.

C. Removal of the Electrical Wiring from Bay 1

- (1) Unscrew self-locking nuts (27-70); remove the hex. head bolts (27-80) and the clips A and B, which hold the wiring harness to the gutter unit.

OVERHAUL

- (2) Unscrew hex. head bolt (27-90); remove clip C and locking plate.
- (3) Unscrew nuts (27-100); remove hex. head bolts (27-110) and clips D and E.
- (4) Unscrew self-locking nuts (27-120); remove hex. head bolt (27-130) and clips F, G and H.
- (5) Unscrew bolt (27-170), remove clip (27-180) and the teflon spiral (27-220).
- (6) Unscrew self-locking nut (27-140) and remove the hex. head bolts (27-150) which retain the distribution box.
- (7) On the bucket position transmitter (indicator) side of the harness, arrange the connectors so that they may be easily withdrawn through the harness guide tube. Retain them with a plastic sheath (P-457).
- (8) Unscrew the hex. head bolts (27-160) which retain the box.
- (9) Carefully withdraw the harness from the guide tube, and remove the wiring harness (27-60) from the structure.
- (10) Fit blanks to the wiring harness connectors.
- (11) Unscrew nut (27-190); remove bolt (27-200) and the support assembly (27-210).

D. Removal of the Electrical Wiring Harness from Bay 2

- (1) Unscrew self-locking nuts (28-180), remove hex. head bolts (26-190) and disengage the connectors from the support.
- (2) Unscrew self-locking nuts (26-90) and (26-110); remove bolts (26-100) and (26-120) along with clips G and H.
- (3) Unscrew self-locking nuts (26-60), remove bolts (26-70) and clips C, E, F and the locking plates.
- (4) Unscrew hex. head bolt (26-80); remove clip D and the locking plate.
- (5) Unscrew nut (26-40), remove bolt (26-50) and clip B.
- (6) Unscrew nut (26-20), remove bolt (26-30) and clip A and the locking plate.

OVERHAUL

- (7) Unscrew hex. head bolt (26-130); remove clip J.
- (8) Unscrew self-locking nut (26-160); remove hex. head bolts(26-170) and clips M, N and P.
- (9) Unscrew self-locking nut (26-140); remove hex. head bolts(26-150) and clips L and K.
- (10) Remove the clip (26-240) and remove the teflon spiral (26-250).
- (11) On the bucket position transmitter (indicator) and of the harness, arrange the connectors so that they may be withdrawn through the harness guide-tube. Retain them with a plastic sheath (P457).
- (12) Unscrew hex. head bolts (26-200) and (26-210).
- (13) Carefully withdraw the electrical harness from the guide-tube and remove the electrical wiring harness (26-10) from the structure.
- (14) Fit blanks to the electrical wiring harness connectors.

15. Removal of the P3 Air Feed Pipe Supports

A. Removal of the Support Bracket (21-10) from Bay 1

- (1) Unscrew self-locking nuts (21-20) and remove plain washers (21-30).
- (2) Remove hi-lock screws (21-40) and remove the laminated shims (21-50).
- (3) Unscrew the self-locking nut (21-60) and remove the plain washer (21-70).
- (4) Remove the hi-lock bolt (21-80); remove the spacer washers (21-110) and (21-90), along with the laminated shim (21-100).
- (5) Unscrew the self-locking nut (21-120) and remove the plain washer (21-130).
- (6) Remove the hi-lock bolt (21-140); remove the plain washers (21-150) and the spacer washers (21-160).
- (7) Remove the support bracket (21-10) from the structure.

B. Removal of Support Bracket (21-170) from Bay 2

- (1) Unscrew self-locking nut (21-180) and remove plain washer (21-190).
- (2) Remove hi-lock screw (21-200) and the laminated shim (21-210).
- (3) Unscrew self-locking nut (21-220) and remove plain washer (21-230).
- (4) Remove hi-lock bolt (21-240); remove plain washers (21-250) and laminated shims (21-260).
- (5) Unscrew self-locking nut (21-270) and remove plain washers (21-280).
- (6) Remove hi-lock bolt (21-290); remove plain washers (21-300), spacer washers (21-310) and laminated shims (21-320).
- (7) Unscrew self-locking nut (21-390) and remove laminated shim (21-400).
- (8) Remove hi-lock bolt (21-370) and the plain washer (21-380).
- (9) Unscrew self-locking nut (21-350) and remove laminated shim (21-360).
- (10) Remove hi-lock bolt (21-330) and spacer washer (21-340).
- (11) Remove the support bracket (21-170) from the structure.

16. Removal of Ball-Screw Gear Box Supports

A. Removal of the Ballscrew Gearbox Support Fitting (25-10)

- \* (1) Unscrew bolt (25-20); remove plain washers (25-30) and the nut plate assembly (25-40A).

NOTE : Discard the nut plate assembly (25-40A). Installation of the support fitting (25-10) will be carried out using nuts (25-40B).

- \*\*\* (1) Unscrew nuts (25-40B) ; remove washers (25-45), bolts (25-20) and washers (25-30).
- (2) Unscrew self-locking nuts (25-70) and remove plain washers (25-80).

- (3) Remove bolts (25-290) and plain washers (25-300).
- (4) Remove the ballscrew gearbox support fitting (25-250) from the structure.

E. Removal of Ballscrew Gearbox Support Fitting (25-330)

Carry out the following operations for each support :

- (1) Unscrew self-locking nuts (25-360) and remove plain washers (25-370).
- (2) Remove bolts (25-340) and plain washers (25-350).
- (3) Remove the ballscrew gearbox support fitting (25-330) and the cruciform spacer (25-380) from the structure.

F. Removal of Ballscrew Gearbox Support Fitting (25-390)

Carry out the following operations for each support :

- (1) Unscrew self-locking nuts (25-420) and remove plain washers (25-430).
- (2) Remove bolts (25-400) and plain washers (25-410).
- (3) Remove the ballscrew gearbox support fitting (25-390) and the cruciform spacer (25-440) from the structure.

17. Removal of the Link Assembly (24-10)

A. Removal of the Link Assembly from the Structure

- (1) Withdraw split-pin (24-20); unscrew hex. nut (24-30) and remove plain washer (24-40).
- (2) Remove shouldered bolt (24-50) and plain washer (24-60)
- (3) Withdraw split-pin (24-70); unscrew hex. nut (28-80) and remove plain washer (24-90).
- (4) Remove shouldered hex. head bolt (24-100) and plain washer (24-110).
- (5) Disengage the link assembly and collect the flanged bushings (24-170) and (24-180).

B. Disassembly of the Link Assembly

- (1) Unlock and unscrew locknut (24-130).

78-13-01

Page 135

OVERHAUL

- (2) Unscrew the end fitting assembly (24-120) and remove the locking nut (24-130).
- (3) Remove flanged bushing (24-150) and (24-160) from the fork end (24-140).

18. Removal of the Welded Housing Assemblies (22-30)

A. Carry out the following operations for each housing assy :

- (1) Unscrew hex.head bolts (22-40) and remove plain washers (24-50).
- (2) Remove the housing assembly from the structure.
- (3) Remove the hex.head bolts (24-10) and the slotted plate assembly (22-20).

19. Removal of the Mounting Pin Assemblies

A. Removal of Mounting Pin Assembly (8-10)

- (1) Remove countersunk head screws (8-20) and covers (8-30).
- (2) Remove countersunk head screws (8-40) and spacers (8-50).
- (3) Withdraw the split pin (8-60) and the lock plate (8-70).
- (4) Unlock the spherical stop (8-90); withdraw the dogged washer (8-80) complete with the stop, and remove the spherical stop.
- (5) Remove the cup washer (8-100) and the mounting pin (8-10).

B. Removal of Mounting Pin Assembly (8-140)

- (1) Remove countersunk head screws (8-150) and covers (8-160).
- (2) Remove countersunk head screws (8-170) and spacers (8-180).

- (6) Remove nut (6-270), and remove washer (6-280).
- (7) Take out bolt (6-290), and remove washer (6-300).
- (8) Remove lower blanking plate (22C-400).
- (9) Recover plain washers (6-305) and (6-375), and spacer (22C-415).

G. Removal of Bay 2 Lower Blanking Plate (22D-460).

- (1) Unscrew bolt (22D-465) and remove washer (22D-470).
- (2) Unscrew hex. head bolts (6-410), and remove plain washers (6-420).
- (3) Take down stiffener (6-430).
- (4) Unscrew bolts (22D-480), and remove washers (22D-485).
- (5) Unscrew bolt (6-730B) and remove washer (6-740B).
- (6) Remove nut (6-640) and washer (6-650).
- (7) Take out bolt (6-660) and remove washer (6-670).
- (8) Take down lower blanking plate (22D-460).
- (9) Recover plain washers (6-675) and (6-745), and spacer (22D-475).

H. Removal of Bay 2 Lower Blanking Plate (22B-230)

- (1) Unscrew bolt (22B-235), and remove washer (22B-240).
- (2) Unscrew bolt (6-380), and remove washers (6-390).
- (3) Take down stiffener (6-400).

78-13-01

OVERHAUL

- (4) Unscrew bolts (22B-245).
- (5) Unscrew bolt (22B-250), and remove washer (22B-255).
- (6) Remove shim(s) (22B-260).

NOTE : Reference-mark the adjusting shims.

- (7) Remove bolt (6-730B) and washer (6-740B).
- (8) Remove nut (6-640) and washer (6-650).
- (9) Take out bolt (6-660), and remove washer (6-670).
- (10) Remove lower blanking plate (22B-230).
- (11) Recover washers (6-675) and (6-745).

I. Removal of Bay 4 Upper Blanking Plates

- (1) Take down upper blanking plate (22A-86) as instructed under 20.A.
- (2) Take down upper blanking plate (22C-361) as instructed under 20.B.

J. Removal of Bay 4 Lower Blanking Plates.

- (1) Take down lower blanking plate (22A-166) as instructed under 20.E.
- (2) Take down lower blanking plate (22C-401) as instructed under 20.F.

K. Removal of Bay 3 Upper Blanking Plates.

- (1) Take down upper blanking plate (22D-501) as instructed under 20.C.
- (2) Take down upper blanking plate (22B-286) as instructed under 20.D.

L. Removal of Bay 3 Lower Blanking plates

- (1) Take down lower blanking plate (22D-461) as instructed under 20.G.
- (2) Take down lower blanking plate (22B-231) as instructed under 20.H.

OVERHAUL

## 21. Removal of Rear End Framework Heat Shield Assemblies.

NOTE : During removal, place the assembly elements on the template - tool SC 266 - in order not to mix them.

### A. Removal of the Bay 1 Upper Heat Shield Assembly.

- (1) Unscrew nuts (5-70) ; withdraw screws (5-80) and remove the clip (5-90).
- (2) Unscrew nuts (5-100) ; withdraw screw (5-110) and remove clip (5-120).
- (3) Unscrew nuts (5-140) and remove the seal assembly (5-130).
- (4) Unscrew nuts (5-160) and remove the seal assembly (5-150).
- (5) Unscrew nuts (5-180) and remove the seal assembly (5-170). Remove the lower seal plate (5-190). Attach this seal plate to the seal (5-170), using lockwire.
- (6) Unscrew nuts (5-210) and remove the seal assembly (5-200).
- (7) Unscrew nuts (5-230) and remove the seal assembly (5-220).
- (8) Unscrew nuts (5-250) and remove the seal assembly (5-240).
- (9) Remove screws (5-310) and washers (5-320).
- (10) Remove screws (5-340) and washers (5-350).
- (11) Remove screws (5-360A) and washers (5-370A).
- (12) Remove the heat shield assembly (5-260).
- (13) Collect the spacer washers (5-330).

### B. Removal of the Bay 2 Upper Heat Shield Assembly.

- (1) Unscrew nuts (5-440) ; withdraw screws (5-450) and remove clip (5-460).
- (2) Unscrew nuts (5-470) ; withdraw screws (5-480) and remove clip (5-490).

(8) Unscrew nuts (6-620) and remove the seal assembly (6-610).

(9) Remove screws (6-680) and washers (6-690).

(10) Remove screws (6-710) and washers (6-720).

(11) Remove screws (6-730A) and washers (6-740A).

(12) Remove the heat shield assembly (6-630).

(13) Recover the spacer assembly (6-700).

G. Removal of the Bay 3 Lower Heat Shield Assembly.

(1) Remove heat shield assembly (6-631) as per instructions in paragraph 20.F.

H. Removal of the Bay 4 Lower Heat Shield Assembly.

(1) Remove heat shield assembly (6-261) as per instructions in paragraph 20.E.

22. Removal of Support Assemblies from the Rear Framework.

A. Removal of Support Assemblies (7-10).

Carry out the following operations for each support assembly :

(1) Unscrew self-locking nuts (7-20) ; remove plain washers (7-40) ; withdraw bolts (7-30) and remove washers (7-35).

(2) Unscrew self-locking nuts (7-80) and (7-120) ; remove plain washers (7-90) and (7-130) ; withdraw bolts (7-100) and (7-140). Recover plain washers (7-110) and (7-150).

(3) Unscrew self-locking nuts (7-50) and remove washers (7-55).

(4) Remove bolts (7-60) and washers (7-65).

(5) Remove the support assembly (7-10) and spacer(7-70).

OVERHAUL

B. Removal of Support Assemblies (7-160).

Carry out the following operations for each support assembly :

- (1) Unscrew self-locking nuts (7-170) ; remove plain washers (7-190), withdraw bolts (7-180) and remove washers (7-185).
- (2) Unscrew self-locking nuts (7-230) and (7-270) ; remove plain washers (7-240) and (7-280) ; withdraw bolts (7-250) and (7-290). Recover plain washers (7-260) and (7-300).
- (3) Unscrew self-locking nuts (7-200) and remove washers (7-205).
- (4) Remove bolts (7-210) and washers (7-215).
- (5) Remove support assembly (6-160) and spacer (7-220).

23. Removal of Heat Shields.

A. Removing Heat Shield (9A-530).

- (1) Remove hex. head bolts (9A-540) and save plain washers (9A-550).
- (2) Remove countersunk head screws (9A-560) and shim (9A-570).
- (3) Take down the heat shield.

B. Removing Heat Shield (9A-580)

- (1) Remove hex. head bolts (9A-590) and save plain washers (9A-600).
- (2) Remove countersunk head screws (9A-610) and shim (9A-600).
- (3) Take down the heat shield.

C. Removing Heat Shield (9A-630)

- (1) Remove hex. head bolts (9A-640) and save plain washers (9A-650).

H. Removing Heat Shield (9B-940).

- (1) Remove hex. head bolts (9B-950) and save plain washers (9B-960).
- (2) Remove hex. head bolts (9B-970) and save plain washers (9B-980).
- (3) Remove hex. head bolts (9B-990) and save plain washers (9B-995).

24. Removal of the Nozzle Side Fairing Assemblies.

NOTE : During removal of the fairing assemblies, arrange the removed parts in the templates - tool SC 199 - to prevent them getting mixed up.

A. Removing Fairing Assembly (9-10).

- (1) Unscrew self-locking nuts (9-260) and withdraw special countersunk head screws (9-250).
- (2) Unscrew self-locking nuts (9-240) and withdraw special countersunk head screws (9-230).
- (3) Unscrew self-locking nuts (9-210) ; remove plain washer (9-220) and withdraw countersunk head screws (9-200).
- (4) Unscrew self-locking nuts (9-180) ; remove plain washers (9-190) and withdraw countersunk head screws (9-170).
- (5) Unscrew self-locking nuts (9-150) ; remove plain washers (9-160) and withdraw countersunk head screws (9-140).
- (6) Unscrew self-locking nuts (9-120) ; remove plain washers (9-130) and withdraw countersunk head screws (9-110).
- (7) Unscrew self-locking nuts (9-80) ; remove plain washers (9-90), spacers (9-100) and countersunk head screws (9-70).
- (8) Unscrew self-locking nuts (9-50) ; remove plain washers (9-60) withdraw countersunk head screws (9-40) and recover angle brackets (9-577) and (9-727).

78-13-01

OVERHAUL

- (9) Unscrew self-locking nuts (9-30) and withdraw countersunk head screws (9-20).
- (10) Remove fairing assembly (9-10) and, if applicable, recover the spacers fitted between fairing and structure or brackets.
- (11) Carry out the same operations to remove fairing assembly (9-11) from the RH twin secondary nozzle assembly.

B. Removal of Fairing Assembly (9-270)

- (1) Unscrew self-locking nuts (9-520) and withdraw special countersunk head screws (9-510).
- (2) Unscrew self-locking nuts (9-500) and withdraw special countersunk head screws (9-490).
- (3) Unscrew self-locking nuts (9-470) ; remove plain washers (9-480) and withdraw countersunk head screws (9-460).
- (4) Unscrew self-locking nuts (9-440) ; remove plain washers (9-450) and withdraw countersunk head screws (9-430).
- (5) Unscrew self-locking nuts (9-410) ; remove plain washers (9-420) and withdraw countersunk head screws (9-400).
- (6) Unscrew self-locking nuts (9-380) ; remove plain washers (9-390) and withdraw countersunk head screws (9-370).
- (7) Unscrew self-locking nuts (9-340) ; remove plain washers (9-350), spacers (9-360) and countersunk head screws (9-330).
- (8) Unscrew self-locking nuts (9-310) ; remove plain washers (9-320), withdraw countersunk head screws (9-300), and recover angle brackets (9-627) and (9-677).
- (9) Unscrew self-locking nuts (9-290) and withdraw countersunk head screws (9-280).
- (10) Remove fairing assembly (9-270) and, if applicable, recover the spacers fitted between fairing and structure or brackets.

78-13-01

OVERHAUL

- (11) Carry out the same operations to remove fairing assembly (9-271) from the RH twin secondary nozzle assembly.

## 25. Removal of Convergent Panels.

A. Removal of Convergent Panels. Carry out the following operations for each bay :

- (1) Remove countersunk head screw (11-20) and (11-30) and remove panel assembly (11-10).
- (2) Remove countersunk head screws (11-50) and (11-60) and remove panel assembly (11-40) and the joint plate (11-130).
- (3) Unscrew countersunk head screws (11-80) and (11-90) ; remove panel assembly (11-100) and the joint plate (11-140).
- (4) Unscrew countersunk head screws (11-110) and (11-120); remove panel assembly (11-70) and the joint plate (11-150).
- (5) Repeat operations (1), (2), (3) and (4) to remove the other half of the convergent section.

## 26. Removal of the Divergent Section Panels.

A. Removal of the Vertical Divergent Panels (12-10).

Carry out the following operations for each panel :

- (1) Remove countersunk head screws (12-60) and special washers (12-70).
- (2) Remove countersunk head screws (12-40) and special washers (12-50).
- (3) Remove countersunk head screws (12-20) and special washers (12-30).
- (4) Remove the vertical divergent panel (12-10).

NOTE : During disassembly, place the parts removed in the templates - tool SC 198 - to avoid mixing them.

B. Removal of the Divergent Panels at 45 deg Position (13-10)  
Carry out the following operations for each panel :

- (1) Remove countersunk head screws (13-60) and special washers (13-70).

**78-13-01**

Page 152

Aug 31/79

- (2) Remove countersunk head screws (13-40) and (13-100) and special washers (13-50) and (13-110).
  - \* (3) Remove countersunk head screws (13-20) and special washers (13-30).
  - \*\* (3) Remove countersunk head screws (13-20)
  - (4) Remove countersunk head screws (13-80) and special washers (13-90).
  - \* (5) Remove the divergent panel (13-10A).
  - \*\* (5) Remove the divergent panel (13-10B).
- NOTE : During disassembly, place the parts removed in the template - tool SC 197 - to avoid mixing them.

C. Removal of the Divergent Panels at 45 deg Position (13-120).

Carry out the following operations for each panel :

- (1) Remove countersunk head screws (13-170) and special washers (13-180).
  - (2) Remove countersunk head screws (13-150) and (13-210) and special washers (13-160) and (13-220).
  - \* (3) Remove countersunk head screws (13-130) and special washers (13-140).
  - \*\* (3) Remove countersunk head screws (13-130).
  - (4) Remove countersunk head screws (13-190) and special washers (13-200).
  - \* (5) Remove the divergent panel (13-120A).
  - \*\* (5) Remove the divergent panel (13-120B).
- NOTE : During disassembly, place the parts removed in the template - tool SC 197 - to avoid mixing them.

D. Removal of Lateral Divergent Panels (14-10).

Carry out the following operations for each panel :

- \* (1) Remove countersunk head screws (14-20) and special washers (14-30).
- \*\* (1) Remove countersunk head screws (14-20).

- \* 301-203-501-0 and 301-201-601-0
- \*\* 301-203-502-0 and subsequent
- 301-203-602-0 and subsequent

- \* (5) Remove countersunk head screws (14-100) and special washers (14-110).
- \*\* (5) Remove countersunk head screws (14-100).
- \* (6) Remove countersunk head screws (14-120) and special washers (14-130).
- \*\* (6) Unscrew countersunk head screws (14-120).
- \* (7) Remove the lateral divergent panel (14-10A).
- \*\* (7) Remove the lateral divergent panel (14-10B).
- \* (8) Recover washers (14-140).

NOTE : During disassembly, place the parts removed in the template - tool SC 196 - to avoid mixing them.

## 27. Removal of the Fire Detection Support Bracket Assembly.

### A. Removal of LH Support Bracket Assembly (23-10).

- (1) Unscrew tubular nut (23-20) and withdraw hi-lock screw (23-30).
- (2) Unscrew self-locking nuts (23-40) and remove plain washers (23-50).
- (3) Remove hi-lock bolts (23-60) and spacer washers (23-80) and plain washers (23-70).
- (4) Remove the support bracket assembly (23-10) from the structure.

- \* 301-203-501-0 and 301-203-601-0
- \*\* 301-201-502-0 and subsequent.
- 301-203-602-0 and subsequent.

OVERHAUL

- (5) Carry out the same operations to remove RH support bracket assembly (23-11) from the RH twin secondary assembly.

B. Removal of LH Support Bracket Assembly (23-90).

- (1) Unscrew tubular nut (23-100) and withdraw hi-lock screw (23-110).
- (2) Unscrew self-locking nuts (23-120) and remove plain washers (23-130).
- (3) Remove hi-lock bolts (23-140) and spacer washers (23-160) and (23-150).
- (4) Remove the support bracket assembly (23-90) from the structure.
- (5) Carry out the same operations to remove RH support bracket assembly (23-91) from the RH twin secondary assembly.

C. Removal of LH Support Bracket Assembly (23-170).

- (1) Unscrew tubular nut (23-180) and withdraw hi-lock screw (23-190).
- (2) Unscrew self-locking nuts (23-200) and remove plain washers (23-210).
- (3) Remove hi-lock bolts (23-220) and spacer washers (23-240) and (23-230).
- (4) Remove the support bracket assembly (23-170) from the structure.
- (5) Carry out the same operations to remove RH support bracket assembly (23-171) from the RH twin secondary assembly.

D. Removal of LH Support Bracket Assembly (23-250).

- (1) Unscrew tubular nut (23-260) and withdraw hi-lock screw (23-270).
- (2) Unscrew self-locking nuts (23-280) and remove plain washers (23-290).
- (3) Remove hi-lock bolts (23-300) and spacer washers (23-320) and (23-310).
- (4) Remove the support bracket assembly (23-250) from the structure.

78-13-01

Page 155  
Aug 31/79

- (5) Carry out the same operations to remove RH support bracket assembly (23-251) from the RH twin secondary assembly.

## 28. Removal of Cover Assemblies.

### A. Removal of Cover Assemblies (20-10).

Carry out the following operations for each cover assembly :

- (1) Slacken the cover screws.
- (2) Remove the cover assembly (20-10) from the structure.

### B. Removal of Cover Assemblies (20-20).

Carry out the following operations for each cover assembly :

- (1) Slacken the cover screws.
- (2) Remove the cover assembly (20-20) from the structure.

### \* C. Removal of Cover Assemblies (20-180A).

Carry out the following operations for each cover assembly :

- (1) Slacken the cover screws.
- (2) Remove the cover assembly (20-180A) from the structure.

### \*\*\* C. Removal of Cover Assemblies (20-180B).

Carry out the following operations for each cover assembly :

- (1) Slacken the cover screws.
- (2) Remove the cover assembly (20-180B) from the structure.

### D. Removal of Cover Assemblies (20-190).

Carry out the following operations for each cover assembly :

- (1) Slacken the cover screws.
- (2) Remove the cover assembly (20-190) from the structure.

## 29. Fitting the Twin Secondary Nozzle Assembly to the Transport Trolley.

- A. Using a hoist, position the hoisting "T" beam - tool SC 195 - to the secondary nozzle assembly, which is fixed to the rotating stand.

- \* 301-203-501-0, 301-203-502-0, 301-203-503-0  
 301-203-504-0, 301-203-505-0, 301-203-601-0  
 301-203-602-0, 301-203-603-0, 301-203-604-0

OVERHAUL

- B. Secure the three slings of the hoisting beam to the fixing points on the upper and side sections.
  - C. Operate the hoists to take up any slack in the slings, and adjust the centre of gravity to balance the load.
  - D. Detach the secondary nozzle assembly from the rotating stand - tool SC 117 - and remove it.
  - E. Position the secondary nozzle assembly on the transport trolley - tool SC 36 - and secure it by the side fixing points at the rear, and the side primary nozzle mounting pin housing.
  - F. Remove the hoisting "T" beam - tool SC 195 -
30. Removal of the Spherical Bearing Housing from the Front Framework.

A. Removal of Bearing Housings (29-110).

Carry out the following operations for each bearing housing :

- (1) Withdraw pin (29-40) and remove the spherical bearing bushing (29-50).
- (2) Withdraw the split pin (29-60). Withdraw the locking ring (29-70) and remove the bearing (29-100).
- (3) Withdraw the split pin (29-80). Withdraw the locking ring (29-90) and remove the bearing housing (29-110).

B. Removal of Bearing Housings (29-180)

- (1) Remove the spherical bearing bush (29-120).
- (2) Withdraw the split pin (29-130). Withdraw the locking ring (29-140) and remove the bearing (29-170).
- (3) Withdraw the split pin (29-150). Withdraw the locking ring (29-160) and remove the bearing housing (29-180).

C. Removal of the Bodge Bolt Trunnion (29-30).

Carry out the following operations on each trunnion :

- (1) Unscrew hex nuts (29-10), withdraw pivot bolts (29-20).
- (2) Remove the bodge bolt trunnion (29-30).

OLYMPUS 593

OVERHAUL

CLEANING

1. General

- A. After disassembly, clean all the parts of the twin secondary nozzle thoroughly in order to remove all the surface contamination such as oils, greases, carbon deposits, corrosion and oxidation marks.
- B. The purpose of cleaning is to :
- (1) Allow thorough visual inspection of parts.
  - (2) Disclose cracks due to system operation through use of fluorescent penetrant inspection methods.
  - (3) Prepare the surfaces in view of future repair work.

2. Specific recommendations.

- A. Any cleaning method selected by an operator shall comply with the following requirements to avoid penalization on the service life of parts.
- (1) Do not degrease titanium parts, welded or not, using halogen products such as chlorinated solvents, trichlorethylene etc...
  - (2) Do not clean in acid baths parts having complex shapes or featuring blind holes i.e. parts on which rinsing or neutralization are difficult to carry out properly.
  - (3) Do not use cleaning agents the action of which may induce generalized or intergranular corrosion of materials, particularly on those materials showing aging due to operation on engine.
- B. Limitations related to electro-platings, chemical surface treatments, paints, varnishes and hardface metal coatings.
- (1) The cleaning methods recommended in this chapter are not harmful to the surface treatments applied on the twin secondary nozzle constitutive parts.
  - (2) To avoid deterioration to surface treatments of parts or to allow their future reconditioning, a list of the coated parts and their location (identification in regards of the illustrated Parts List) is given here - under.

**ATP  
TEMPORARY  
REVISION**

**BRITISH AIRWAYS**  
OLYMPUS 593 OVERHAUL MANUAL  
EXHAUST SYSTEM TWIN SECONDARY NOZZLE

This Temporary Revision complies with BCAR's Chapter A6-2 and TSS No. 0-2.

*W. Chubb*

for Chief Engineer (Technical & Quality Services) CAA Design Approval No.  
DA1/8566/78

**TEMPORARY REVISION 78-525**

Insert in 78-13-01 facing page 301

**REASON FOR ISSUE**

To introduce a Refurbishment Specification to the Twin Secondary Nozzle Overhaul (MCR.EPO.450/MD).

**ACTION**

Concorde Exhaust System Refurbishment

Introduction

The exhaust system consists of four main components:-

- (a) The Reheat Jet Pipe
- (b) The Primary Nozzle
- (c) The Twin Secondary Nozzle
- (d) The Thrust Reverser Bucket

Their Refurbishment Specifications are as follows:-

Reheat Jet Pipe	CON 78.11.01.100 Issue 1
Primary Nozzle	CON 78.12.01.100 Issue 1
Twin Secondary Nozzle	CON 78.13.01.100 Issue 1
Thrust Reverser Bucket	CON 78.31.01.100 Issue 1

These refurbishment schedules fulfil the life development requirements of the Approved Maintenance Schedule (A.M.S.).

The work listed in the Refurbishment Schedule is to allow the unit to be considered as a "Condition Monitored" (C.M.) unit.

This means that such units are currently considered to have no known hidden "wear out" features that require planned time interval specific inspections. However, such units may be required to be stripped and inspected purely to gain experience of their condition, i.e. life samples when it is considered that opportunity arisings of strip and inspection are inadequate. Such life sampling requirements will be indicated by an A.M.S. revision.

Notes

Where the term "visual inspection" is used, it implies a visual inspection of all parts exposed arising either as a result of the minimum work content of the Refurbishment Schedule or to a greater depth of strip dictated by other reasons, i.e. repair of damage embodiment of modifications, etc.

When in the course of visual inspection evidence exists, e.g. wear witness, distortion, etc. that requires further stripping, it must be referred to Propulsion Engineering for a review of acceptance standards and agreement to further strip.

# BRITISH AIRWAYS

## OLYMPUS 593 OVERHAUL MANUAL EXHAUST SYSTEM TWIN SECONDARY NOZZLE

TEMPORARY REVISION No. 78-525 (Cont'd.)

### Concorde Exhaust System Refurbishment Twin Secondary Nozzle

Specification No. CON 78.13.01.100 Issue 1

1. The Secondary Nozzle is to be disassembled IAW OHM 78-13-01 P/B 100.
2. At the completion of disassembly clean thoroughly all the parts of the secondary nozzle so as to remove all surface contamination such as oils, greases, carbon deposits, corrosion and oxidisation marks IAW OHM 78-13-01 P/B 200.
3. Crack detect parts listed in OHM 78-13-01 Page 305 to 309 using processes specified. Parts failing to meet the required standard must be held for possible repair development.
4. Visually inspect all parts IAW OHM 78-13-01 P/B 300 and repair as required. Any part that is damaged beyond the repair limits must be held for possible repair development. Any part that is damaged and has no cleared repair scheme must be held for possible repair development.
5. Embody Modifications IAW the BA Modification call up list.
6. Inform Propulsion Engineering of any defects found during refurbishment.
7. Re-assemble the Secondary Nozzle IAW OHM 78-13-01 P/B 500.
8. The Secondary Nozzle inspection and release documentation is to state the specification number to which the unit has been refurbished.

OLYMPUS 593

MK.610-14-28

OVERHAUL

INSPECTION

1. Breakdown of the Inspection Section

The "Estimate" inspection of the Twin Secondary Nozzle assembly includes the following chapters :

- General
- Twin Secondary Nozzle assembly - Removable parts
- Basic Twin Secondary Nozzle

The latter chapter is itself divided in paragraphs as follows:

- Introduction
- Identification
- Restricted areas
- Inspection methods
- Permissible damage

2. General

A. Inspection - General

- (1) The Estimate Inspection, prepared during overhaul on the modules or separate disassembled components, has the object of :

Eliminating worn or deteriorated components which are impossible or too costly to be repaired. However, these components can be kept because certain sound portions of them may be usable for the repair of an identical component.

Indicating the modifications to be applied to bring up to a new Standard.

78-13-01

OVERHAUL

Indicating the repairs to be carried out. If this repair has not been envisaged in the Repair Section of the Manual, make a request to SNECMA - Après-Vente Civile Site de MELUN MONTEREAU Aérodrome de VILLAROCHE BP 1936 - 77019 MELUN CEDEX (FRANCE).

Eliminating components that have reached their life limitation.

B. Preparation to the "Estimate" Inspection

- (1) Following disassembly, suitable cleaning for each component is given in the "Cleaning" section of the Overhaul Manual.

NOTE : Take care that any assembly "awaiting inspection" be stored in the "bins" or containers for this purpose.

This inspection must be carried out on thoroughly clean parts.

Place all the parts, making up the sub-assemblies, on the inspection tables covered with anti-shock material (lino or similar material).

- (2) Make a list of the modifications to be applied for each sub-assembly.
- (3) Inspect the parts.

C. "Estimate" Inspection

CAUTION : THE COMPONENTS MUST BE HANDLED WITH THE GREATEST CARE DURING THE INSPECTION OPERATIONS SO AS TO AVOID SHOCKS, SCRATCHES, ETC ...

- (1) Personnel in charge of this inspection must have a thorough knowledge of the instructions given in the Inspection and Repair sections of this manual and in the corresponding chapter 70.

They must be conscious of the importance of their decisions and of their consequences. A good technical and functional knowledge of the accessory will enable this personnel to carry out an efficient and intelligent inspection, particularly in vital zones.

PRINTED IN FRANCE

GENERAL

Page 302

Apr 30/93

- (2) The inspection methods to be used are as follows:

Visual inspection

Inspection for soundness

Dimensional inspection

NOTE: It is recommended that these inspection methods be followed as per the indicated order so that faulty, not repairable components detected during visual or soundness inspections can be scrapped prior to dimensional inspection.

If new types of defects are disclosed, the repairer shall request SNECMA to design a repair scheme.

- (3) Measuring instruments for dimensional inspection

Choice of the measuring instrument must be made in relation to the precision desired.

(a) Instrument classification

Two kinds of measuring instruments are to be distinguished:

Standard and universal inspection tools such as: slide gages, micrometers, depth gages, miscellaneous dial gages, etc.

This equipment is part of the provisioning items commercially available and requires no particular comment provided that it is available in the required quantity and precision, and satisfies to the requirements for the work to be undertaken.

Special inspection equipment such as: bases, supports, rigs, jigs, etc.

These tools are identified by a type number in the manual text at the exact place where they are used.

(b) Calibration

Measuring instruments used in overhaul are to be checked periodically according to a procedure defined in relation to master instruments (SNECMA to be informed of procedure), themselves checked

OLYMPUS 593

MK. 610-14-28

OVERHAUL

sneema

in relation to the official master instruments of the country concerned.

The Official Control Authorities of the countries where repairs are carried out will have to take steps to ensure that the repairer has set up suitable facilities and equipment.

In the absence of a procedure in the countries concerned, the repairer will request from SNECMA the procedure applied in their own workshop.

- (4) During the inspection, each component must be labelled (see chapter 70-10-00) so as to indicate:

If it is suitable to be put back into service.

If a repair is necessary.

If it must be renewed.

Labelling of components may also be used to note the value of certain measured dimensions which can affect a clearance or a tolerance. This makes it possible for the Inspection Dpt. to check the clearance or tolerance during final assembly.

#### D. Protection against corrosion after inspection

- (1) After inspection, when 3 months elapses before rebuild, apply a temporary protection to carbon steel, alloy steel and martensitic alloy parts using a dessicant oil such as Ensis Fluid 254 (P309) or ARDROX 396/1E8 (P373) or RUSTILO DW377 (P373).

## INSPECTION

### TWIN SECONDARY NOZZLE ASSEMBLY - REMOVABLE PARTS

#### 1. Introduction

This chapter gives all the data needed for the visual, soundness and dimensional inspections to be carried out on the removable parts of the Twin Secondary Nozzle assembly.

#### 2. Visual inspection

A. Visual inspection is an operation which starts on reception of the accessory (inventory), continues during disassembly, on table inspection, re-assembly, testing and dispatching.

- (1) Visual inspection generally concerns the following points :

Each part is inspected to ascertain its general condition and make sure that it is fit for service. Refer to chapter 70-21-00.

Threads and tapped holes must not be deteriorated.

Rivets used to attach the various components on riveted assemblies must not be shaken loose, rotating or missing, otherwise change them.

Self-locking nuts must have a satisfactory locking torque. See chapter 70-21-30, otherwise change them.

Crimped self-locking nuts must be satisfactorily crimped. See chapter 70-21-30, otherwise change them.

Hinge parts (such as pins/bores of bushes; ball joint inner ring/outer ring of rods ...) must not show seizing marks or scratches, otherwise remove them by emery cloth.

Components made up of sheet metal elements and/or "Stresskin" material must not show nicks, tears, heavy distortions and/or, burns.

Parts featuring plated areas (metallization) must not show flaking conditions, otherwise renew the metallization as indicated in the "Repair" section of the Manual

**78-13-01**

TWIN SEC. NOZZLE ASSY. - REMOVABLE PARTS

Page 301

Jan 15/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

Parts featuring a protective surface coating must not show bare or flaked areas, otherwise recondition coating as indicated in "Repair" section of the Manual.

- (2) Measures to be taken in relation to the damage affecting the parts are given in paragraph 5 "Parts Inspection".

### 3. Inspection for soundness

- A. The object of the inspection for soundness is to ensure that the components are not cracked.

The inspection methods used are as follows :

Visual inspection :

This inspection can be carried out using a binocular magnifying glass (magnification X 10) or a borescope.

Aural inspection :

This method is used to check Stressskin panels and described in paragraph 5 "Parts Inspection".

Dye penetrant inspection : see chapter 70-20-10.

M 502 - Water-washable fluorescent penetrant inspection.

M 504 - Post-emulsification fluorescent penetrant inspection.

NOTE : M 502 A or M 504 A : for titanium made parts  
M 502 B or M 504 B : for all parts except titanium parts.

Radiographic inspection : see chapter 70-20-30.

using X-rays  
using gamma-rays

- B. The following table gives the list of parts and their appropriate methods.

#### 4. Dimensional Inspection of Parts

Details concerning the dimensional inspection and the acceptance criteria are given in paragraph 5 "Parts Inspection".

#### 5. Parts Inspection

##### A. Deflector Assy (1-10/200)

###### (1) Visual inspection

- (a) Check that deflector blade or cover plate are not out of shape.

Otherwise, re-shape them.

###### (2) Inspection for soundness

- (a) Renew cover plate if showing cracks, per REP 1-10-1.
- (b) Repair cracked deflector assemblies LH and RH in accordance with BOR 15.

1 A crack of less than 20 mm (0.787 in.) in length on the leading edge of a blade to be repaired per REP 1-10-2.

##### B. Strip Cover (1-100/290)

###### (1) Visual inspection

- (a) Check that strip cover is not out of shape.  
If cover strip is out of shape, withdraw from service pending the establishment of a repair procedure.

###### (2) Inspection for soundness

- (a) The presence of cracks in the cover strip is not acceptable. A cracked cover strip must be withdrawn from service pending the establishment of a repair procedure.

**78-13-01**

OLYMPUS 593

MK.610-14-28

OVERHAUL

C. Safety Pin (2-130)

(1) Visual inspection

- (a) Check that safety pin centering diameter is free from any seizing indent or scratch.

Otherwise, eliminate them using an emery cloth.

(2) Dimensional inspection

- (a) Should there be a reworking of safety pin centering diameter, check that its value remains greater than 12,18 mm (0.4796 in.).

If not, scrap the pin.

D. Bucket Bearing Trunnion (2-160/170/260/350)

(1) Visual inspection

- (a) Seizing indents or scratches on centering diameter must be eliminated using an emery cloth.

- (b) Check that thread for trunnion extraction is in good condition.

If thread shows sign of damage, withdraw from service pending the establishment of a repair procedure.

(2) Dimensional inspection

- (a) Check that centering diameter is greater than 47,57 mm (1.8728 in.).

If this is not so, withdraw trunnion from service pending establishment of repair procedure.

E. Trunnion Locking Pin (2-200/290/380)

(1) Visual inspection

- (a) Check that pin centering diameter is free from seizing indents or scratches.

Otherwise, eliminate them using emery cloth.

78-13-01

OVERHAUL

(2) Dimensional inspection

- (a) If it is necessary to rework pin centering diameter, check that its value remains greater than 9,48 mm (0.3735 in.).

Otherwise, scrap the pin.

F. Access Door Assy (3-10/150/170/190/330/331/350/351/370/371)  
and (4-10/30/31/50/51/70/71/100/101)

(1) Visual inspection

- (a) Check that inserts are correctly crimped.

Otherwise, renew those found to be defective according to instructions in REP 3-10-3.

- (b) Check the condition of stiffeners on doors (3-330) and (4-10) together with securing parts.

In case of damage or failure, replace defective part per REP 3-10-2.

- (c) Check that the "Stressskin" panel is free from indents or nicks.

Otherwise, rework the door per REP 3-10-4.

- (d) Check that tungsten carbide protection of areas in contact with secondary nozzle is not flaked or worn out.

Otherwise, rework it per REP 3-10-1.

(2) Inspection for soundness

- (a) Cracks developing in "Stressskin" panel skins together with delamination of internal ribbon are unacceptable and require door repair.

G. Sleeve Assembly (3-70/130)

(1) Visual inspection

- (a) Check that pin is not damaged or shaken.

Otherwise, renew it.

78-13-01

H. Seal Assy (5-130/150/170/200/220/240/500/520/540/570/590/610) and (6-130/150/170/200/220/240/500/520/540/570/590/610)

(1) Visual inspection

(a) Check condition of seal blades and stiffeners.

In case of crack, tearing, deformation or important wear, replace the damaged item as instructed in REP 5-130-1.

I. Heat Shield Assy (5-260/261/630/631) and (6-260/261/630/631)

(1) Visual inspection

(a) Check condition of reinforcements and relevant riveting.

If damaged, renew them as per REP 5-260-1.

(b) Check contact zone of seal assemblies.

If there are signs of an unacceptable level of wear, recondition zone per REP 5-260-3.

(2) Inspection for soundness

(a) Cracks developing in heat shields are unacceptable.

If cracks are present, repair by welding per REP 5-260-2.

J. Support Assembly (7-10/160)

(1) Visual inspection

(a) Check condition of floating nut.

Nut in poor condition (silver plating removed, inefficient spring mechanism...) is unacceptable and must be renewed per REP 7-10-1.

(1) Visual inspection

- (a) Check that there is no scratch, or other surface deterioration on centering diameters, on outer diameter of bushing and mating face.

Otherwise, eliminate them by lapping within the following dimensional specifications.

(2) Dimension inspection

- (a) Check systematically pin centering diameters (see Figure 301).

They must be :

dia. A = 64,44 mm min. (2.5369 in.)

dia. C = 58,36 mm min. (2.2977 in.).

Below these values, store the part pending repair.

dia. B = 31,97 mm min. (1.2586 in.)

Below this value, replace the bushing following repair REP 8-10-1.

P. Rear Fairing Assembly (9-10/11/270/271)

(1) Visual inspection

- (a) Loosened or missing reinforcement sheet attachment rivets are unacceptable, they must be replaced per REP 9-10-1.
- (b) Damages due to contact with the elevon junction are acceptable if there is no crack.

Otherwise, store the part pending repair.

(2) Inspection for soundness

(a) Inspection methods

The 2 inspection methods described below are complementary :

. Dye penetrant inspection :

Water washable fluorescent penetrant inspection is to be carried out according to method M 502 B of chapter 70-20-10.

The purpose of these inspection is to find out cracks likely to develop :  
from attaching points,  
in panel crushing or shape evolution areas,  
from possible damages.

. Radiographic inspection :

This inspection is carried out using an X-ray set fitted with a long anode, as shown in figure 302.

The purpose of this inspection is to point out peeling-off or deterioration of "Stressskin" panel ribbon or cracks developing under reinforcement sheets.

(b) Acceptance criteria

If cracks of any type are found, they are to be eliminated per REP 9-10-2.

Peeling-off or internal deterioration of ribbon is not acceptable. Repair this damage per REP 9-10-2.

Q. Heat Shield (9-530/531/580/581/630/631/680/681/730/731/800/801/870/871/940/941)

(1) Visual inspection

(a) Check condition of floating anchor nuts.

. Any deterioration on silver plating or locking torque is inadmissible and requires replacement of these nuts according to REP 9-530-1.

301/321/341/361/381/401/421/441/461/481)

(1) Visual inspection

(a) Wear marks are acceptable after surface smoothing  
if not associated with crack or penetration.  
Otherwise, scrap the seal.

S. Threaded Pin (10-490)

(1) Visual inspection

(a) Check that there are no wear marks or other sur-  
face deteriorations over pin centering diameter.  
If any, eliminate them by using an emery cloth  
within dimensional limits.

(2) Dimensional inspection

(a) Check that pin diameter is not less than 12,62 mm  
(0.4970 in.).  
Otherwise, store the pin pending repair.

T. Convergent Panel (11-10/40/70/100)

(1) Visual inspection

(a) Check that insert crimping is correct.  
Otherwise, renew defective inserts according  
to REP 11-10-1.

(b) Check that the plasma plating in panel mating  
areas is neither flaked nor worn out.  
Otherwise, rework it according to REP 11-10-2.

(c) Check that the "Stressskin" panel is free from  
indent or nick.  
Otherwise, recondition according to REP 11-10-3.

78-13-01

Page 319

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

(2) Inspection for soundness

(a) Inspection method

Carry out an aural inspection by lightly tapping the "Stresskin" panel with a metal part such as a coin.

The purpose of this inspection is to show up a peeling-off or a deterioration of the internal ribbon.

A panel in good condition gives a clear sound.

A panel with a damaged ribbon gives a dead sound.

(b) Acceptance criteria

Peeling-off or internal deterioration of ribbon is unacceptable.

Recondition panel according to REP 11-10-3.

U. Joint Plate (11-130/140/150)

(1) Visual inspection

- (a) Check condition of self-aligning nuts. Deterioration of silver plating, locking torque or travel is unacceptable and requires their renewal according to REP 11-130-1.

V. Divergent Panel (12-10, 13-10/120, 14-10)

(1) Visual inspection

- (a) Wear marks on reinforcing part are acceptable if no crack is detected.

Otherwise, store the part pending repair.

- (b) It is acceptable for the panel to be worn out by less than 0,5 mm (0.020 in.) at attaching point locations, i.e. a min sheet thickness equal to 1 mm (0.039 in.).

Beyond these values, store the part pending repair.

78-13-01

Page 320

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (c) Ensure that crimping of special washer is correct.  
Otherwise, renew the defective crimped washers  
according to REP 12-10B-1.

(2) Inspection for soundness

- (a) Cracks of any types are unacceptable.  
If any, store the part pending repair.

W. Attaching Bolt (16-50)

(1) Visual inspection

- (a) Check that bolt surface is free from scratches or  
other damages.  
Otherwise, eliminate them using an emery cloth  
within dimensional limits.

(2) Dimensional inspection

- (a) Check that bolt diameter is not less than  
12,66 mm (0.4984 in.).  
Otherwise, store the part pending repair.

X. Spherical Bearing (16-120/170)

(1) Visual inspection

- (a) Check that the outer spherical diameter of bea-  
ring, together with bore, are free from scratches  
or other surface deterioration.  
Otherwise, eliminate them using an emery cloth  
and remaining within dimensional limits.

(2) Dimensional inspection

- (a) Check that spherical diameter is not less than  
14,26 mm (0.5614 in.) and that the bore is not  
greater than 7,94 mm (0.3125 in.).  
Beyond these values, scrap the part.

78-13-01

Y. Spherical Bearing Housings (16-130/180)

(1) Visual inspection

- (a) Check that the spherical bore is free from scratches or other surface damages.

Otherwise, eliminate them using an emery cloth within dimensional limits.

(2) Dimensional inspection

- (a) Check that the spherical bore is not greater than 14,31 mm (0.5634 in.).

Otherwise, scrap the part.

Z. Welded Bracket (16-220/250)

(1) Visual inspection

- (a) Check that self-locking nuts are in good condition.

Otherwise, renew them according to REP 16-220-1.

(2) Inspection for soundness

- (a) Cracks are unacceptable and must be eliminated by filler welding.

AA. Elbow Assembly (17-110/170)

(1) Visual inspection

- (a) Check that the flange tapered surface is free from scratches or other surface deteriorations, and that chrome plating is in good condition.

Otherwise, rework tapered surface chrome plating according to REP 17-110-1.

(2) Inspection for soundness

- (a) Cracks developing in weld beads are unacceptable and must be eliminated by welding according to REP 17-110-2.

78-13-01

AB. Exhaust Elbow Assembly (17-150/210)

(1) Visual inspection

- (a) Make sure that the valve operates properly.  
If not, renew it.

(2) Inspection for soundness

- (a) Cracks developing in weld beads are unacceptable and must be eliminated by filler welding according to REP 17-150-1.

AC. Pin Assy (17-270B)

(1) Visual inspection

- (a) Check that the pin external diameter is free from scratches and other surface damages.  
Otherwise, eliminate them using emery cloth.
- (b) Check that the bushing tight fitted on the pin does not rotate freely.  
Otherwise, discard the assembly.

(2) Dimensional inspection

- (a) Check that the external diameter of the bushing is greater than 12,68 mm (0.4992 in.).  
Otherwise, scrap the part.

AD. Pin Assy (17-310B)

(1) Visual inspection

- (a) Check that the pin external diameter is free from scratches and other surface damages.  
Otherwise, eliminate them using emery cloth.
- (b) Check that the bushing, tight fitted on the pin, does not rotate freely.  
Otherwise, discard the assembly.

78-13-01

OVERHAUL

(2) Dimensional inspection

- (a) Check that the external diameter of the bushing is greater than 9,49 mm (0.3736 in.).

Otherwise, scrap the part.

AE. Bushing (17-320)

(1) Visual inspection

- (a) Check that the external diameter together with bushing bore are free from scratches and other surface damage.

Otherwise, eliminate them using an emery cloth.

(2) Dimensional inspection

- (a) Check that the external diameter is greater than 9,49 mm (0.3736 in.) and bore is less than 6,37 mm (0.2508 in.).

If not, scrap the part.

AF. Bushings (17-370/380/390/400)

(1) Visual inspection

- (a) Check that the external diameter and the internal diameter are free from scratches and other surface damage.

Otherwise, eliminate them using emery cloth.

(2) Dimensional inspection

- (a) Check that the external diameter is greater than 12,68 mm (0.4992 in.) and that the internal diameter is less than 9,56 mm (0.3764 in.).

Otherwise, scrap the part.

AG. Link Assembly (18-10)

(1) Visual inspection

- (a) Manually make sure that ball joint is free in rotation.

78-13-01

TWIN SEC. NOZZLE ASSY. - REMOVABLE PARTS

Page 324

Jun 15/82

OLYMPUS 593

MK.610-14-28  
OVERHAUL

Otherwise, renew the ball joint end-piece.

(2) Dimensional inspection

- (a) Check that link bores are meeting the following dimensions.

Ball joint bore 6,35 mm dia. (0.2500 in.) max.

Bushing housing 9,45 mm (0.3756 in.) max.

Beyond these tolerances scrap the damaged part.

AH. Bushing (18-60/70)

(1) Visual inspection

- (a) Check that the internal and external diameters of bushing are free from scratches and other surface damage.

Otherwise, eliminate these defects using emery cloth.

(2) Dimensional inspection

- (a) Check that the diameters of bushings comply with following dimensions :

internal diameter 6,37 mm (0.2508 in.) max.

upper diameter 9,516 mm (0.3746) min.

- (b) Otherwise, scrap the bushing.

AI. Elbow Assembly (18-110/190)

(1) Visual inspection

- (a) On elbow (18-110) manually make sure that the ball joint is free in rotation.

Otherwise, renew ball joint.

- (b) Make sure the heat resistant varnish on the conical flange seating is in good condition. Otherwise, recondition the varnish in accordance with the instructions of REP 18-110-1 (silver plating) or of REP 18-110-4 (varnishing).

## (2) Inspection for soundness

- (a) Cracks developing in weld beads are unacceptable and must be eliminated by filler welding.

## (3) Dimensional inspection

- (a) Check that ball joint bore is not greater than 6,35 mm dia. (0.2500 in.).  
Otherwise, renew the ball joint.

## AJ. Isolation Valve Bracket (18-270/290)

CAUTION : VALVE BRACKET MUST SYSTEMATICALLY BE SENT TO REPAIR TO REWORK ANTI-SEIZING VARNISH ON BALL JOINT AND BALL JOINT HOUSING ACCORDING TO REP 18-270-1.

## (1) Visual inspection

- (a) Manually make sure that the ball joint is free in rotation.  
Otherwise, renew ball joint.

## (2) Dimensional inspection

- (a) Check that ball joint bore is not greater than 12,02 mm (0.4732 in.).  
If not, scrap the part.
- (b) Check that the clearance between ball joint and its housing is not greater than 0,1 mm (0.0039 in.) with respect to the diameter.  
Otherwise, renew ball joint/housing assembly.

## AK. Tube Assembly (18-340/430)

## (1) Visual inspection

- (a) Make sure the heat resistant varnish on the conical flange seating is in good condition.  
Otherwise, recondition the varnish in accordance with the instructions of REP 18-340-1 (silver plating) or of REP 18-340-4 (varnishing).

- (b) Check that spherical end-piece chrome plating is in good condition.

If not, rework chrome plating according to REP 18-340-2.

(2) Inspection for soundness

- (a) Cracks developing in weld beads are acceptable and must be eliminated by filler welding according to REP 18-340-3.

AL. Yoke Assembly (18-560)

(1) Dimensional inspection

- (a) Check that bushing bores are not greater than 6,37 mm (0.2508 in.).

Otherwise, renew bushings.

AM. Pivot (18-660)

(1) Visual inspection

- (a) Check that pivot is free from scratches or other surface damages.

Otherwise, smooth down by using an emery cloth within dimensional limits.

(2) Dimensional inspection

- (a) Check that pivot diameter is not less than 11,97 mm (0.4715 in.).

Otherwise, scrap the part.

AN. Nut (19-40/140)

(1) Visual inspection

- (a) Check that nut silver plating is correct.

Otherwise, rework silver plating according to REP 19-40-1.

AO. Spherical Bearing (19-90/190)

(1) Dimensional inspection

- (a) Check that spherical bearing dimensions comply with the following :

spherical dia. : 12,68 mm (0.4992 in.) min.

bore : 6,35 mm (0.2500 in.) max.

If these values are not respected, scrap the part.

AP. Pipe Assembly (19-100/200)

CAUTION : THE PIPE ASSEMBLY MUST SYSTEMATICALLY BE SENT TO REPAIR TO REWORK SPHERICAL BEARING HOUSING ANTI-SEIZING VARNISH ACCORDING TO REP 19-100-1.

(1) Visual inspection

- (a) Make sure the heat resistant varnish on the conical flange seating is in good condition. Otherwise, recondition the varnish in accordance with the instructions of REP 19-100-2 (silver plating) or of REP 19-100-4 (varnishing).

(2) Inspection for soundness

- (a) Cracks developing in weld beads are unacceptable and must be eliminated by filler welding according to REP 19-100-3.

(3) Dimensional inspection

- (a) Check that flange spherical bore is not greater than 12,72 mm (0.5008 in.).

Otherwise, store the pipe pending repair.

AQ. Rod Assembly (19-210/290/410)

(1) Visual inspection

- (a) Manually, make sure that ball joint is free in rotation.

Otherwise, renew swivel end-piece.

AT. Bushing (19-390/400/510/520)

(1) Visual inspection

- (a) Check that the external diameter of the bushing is free from scratches or other surface defects. Otherwise, eliminate these defects using emery cloth.

(2) Dimensional inspection

- (a) Check that the external diameter is greater than 9,51 mm (0.3744 in.) and that the internal diameter is less than 6,38 mm (0.2512 in.). Otherwise, replace the part.

AU. Support (20-150)

(1) Visual inspection

- (a) Check that the bore accommodating trunnion (20-170) is free from scratches or other surface deterioration. Otherwise, smooth down surface deteriorations within dimensional limits.

(2) Dimensional inspection

- (a) Check that the bore accommodating trunnion is not greater than 25,80 mm (1.0157 in.). Otherwise, recondition bore according to REP 20-150-1.

AV. Trunnion (20-170)

(1) Visual inspection

- (a) Check that chrome plating on spherical diameter and in trunnion bore is in good condition.

If damaged, rework it according to REP 20-170-1.

(2) Dimensional inspection

- (a) Check that spherical diameter is not less than 25,65 mm (1.0098 in.).

Otherwise, rework trunnion chromium plating according to REP 20-170-1.

AW. Slotted Plate (22-20)

(1) Visual inspection

- (a) Make sure that spacer end threads are in good condition.

If not, scrap the part.

(2) Inspection for soundness

- (a) Cracks developing in weld beads are unacceptable and must be eliminated by filler welding.

AX. Welded Housing Assembly (22-30)

(1) Visual inspection

- (a) Check that riveted nuts are in good condition. Should locking torque or nut protection be damaged, renew them.

(2) Inspection for soundness

- (a) Cracks developing in weld beads are unacceptable and must be eliminated by filler welding.

AY. Bracing Assy (22-80/81/160/161/225/226/280/281/355/356/395/396/455/456/495/496)

(1) Visual inspection

- (a) Check the state of blanking plate around the attachment points at the intersection between rear frame and vertical panel of twin secondary assembly.

If there is deterioration or tearing away of metal, repair according to REP 22-85-2.

(2) Inspection for soundness

- (a) Cracks developing in weld beads or in bending areas are inadmissible and must be fill-up welded according to REP 22-85-1.

BA. Bracket (23-10/90/170/250 and 23-11/91/171/251)

(1) Visual inspection

- (a) Check that brackets are not distorted.  
Otherwise, scrap them.

- (b) Check that nuts are in good condition.

If locking torque or nut protection are damaged, renew them according to REP 23-10-1.

BB. Link Assembly (24-10)

(1) Visual inspection

- (a) Manually, check that ball joint is free in rotation.

Otherwise, renew ball joint.

- 1 Centering diameter of trunnion 29-30 :  
11,096 mm min. (0.4368 in.).
- 2 Centering diameter of pivot in twin secondary  
assembly : 7,91 mm min. (0.3114 in.).

- (b) If dimensions do not comply with these tolerances,  
withdraw part from service pending repair.

BH. Trunnion (29-30)

(1) Visual inspection

- (a) Check that trunnion bores are free from scratches  
or other surface defects.
- (b) If not, smooth using emery cloth and within  
dimensional limits.

(2) Dimension inspection

- (a) Check that the bores are less than 11,15 mm in  
diameter (0.4390 in. dia.).
- (b) If not, withdraw the part from service pending  
the establishment of a repair procedure.

BI. Harness, Primary Nozzle Area Transducer (30-1)

(1) Visual inspection

- (a) Visually inspect all the parts providing for  
electrical connections.

Scrap systematically the components showing the  
following defects :

- components showing overheating marks,
- ripped (torn) sheathes,
- wires with defective insulating material,
- wires with strands severed at the crimped, end  
of pins/sockets,

INSPECTION

## BASIC TWIN SECONDARY NOZZLE

### 1. Introduction

This chapter gives all the pertinent information to carry out the visual, soundness and dimensional inspections of the basic twin secondary nozzle.

These information are arranged in the following order :

#### Paragraph 2 - Identification

This paragraph provides for identification of the secondary nozzle basic components and gives the material constituting each component as well as the thickness of parts manufactured from sheet metal material.

#### Paragraph 3 - Restricted areas

This paragraph defines the structural areas for which the mechanical strength is the essential criterion and to which any damage and repair might affect the useful life of the twin secondary nozzle.

#### Paragraph 4 - Inspection methods

This paragraph defines the visual, aural and radiographic methods used for inspection of the twin secondary nozzle.

#### Paragraph 5 - Permissible damage

This paragraph specifies the damage extents beyond which it is necessary to comply with a specific repair scheme.

## 2. Identification

This paragraph defines the secondary nozzle basic components.

These are classed in two categories :

- Secondary nozzle structure
- Secondary nozzle inner and outer stressskin panels.

### A. Secondary nozzle structure

The structural components are defined on figures 301 through 306.

For each component is given :

- the material identification (P xxxx type, refer to the SNECMA's Products File, or AFNOR type for forged and/or cast parts)
- the material thickness for the parts manufactured from sheet metal.

### B. Secondary nozzle inner and outer stressskin panels

These components are defined on figures 307 through 309.

For each component is given :

- the material identification (P xxxx type, refer to the SNECMA's Products File).
- the panel thickness

NOTE : In the case of a chemically milled panel, it is illustrated separately so that to outline on a diagram the thickness variations on both its internal and external face sheets. These information are necessary in order to ensure correct assessment of damage.

### C. Twin secondary nozzle effectivity

This paragraph "Identification" includes all the variants of twin secondary nozzles; as a result, the effectivity is indicated on all the pages wherein differences between secondary nozzles appear.

**78-13-01**

BASIC TWIN SEC. NOZZLE - IDENTIFICATION

Page 301

Jan 15/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

Effectivity is expressed as follows :

(1) Summary of all the secondary nozzle variants.

This information is given by Table I and is stated as follows :

Example : 

A	Secondary nozzles	}	IPL Codification
B	Secondary nozzles		
C	All secondary nozzles but those indicated in <span style="border: 1px solid black; padding: 0 5px;">A</span> and <span style="border: 1px solid black; padding: 0 5px;">B</span> .		

(2) On the illustrations :

- (a) In the case where any one page "Identification" is applicable to all the secondary nozzles, the effectivity is not indicated..
- (b) In the case where any one page "Identification" includes pieces of information relative to different variants of secondary nozzles, the following cases are to be taken into account :

1st case - The concerned zone keeps the same graphic representation, but certain parts are manufactured from an other material or incorporate minor changes thus requiring complementary data in the identification table.

In this case, effectivity is indicated by :

- placing the framed letter near the part's identification index
- adding, below the previously existing index, a new index followed by the framed letter corresponding to the variant

Example :

20

A

Part's old configuration corresponding to nozzles variant A

100

C

Part's new configuration corresponding to all nozzles except variant A

**78-13-01**

BASIC TWIN SEC. NOZZLE- IDENTIFICATION

Page 302

Jan 15/76

OLYMPUS 593

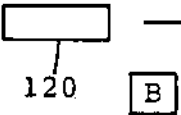

MK.610-14-28

OVERHAUL

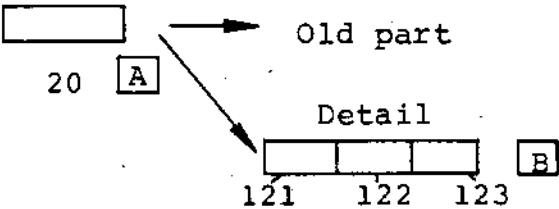

2nd case - In the concerned zone, a new component, specific to one nozzle or a batch of nozzles, is incorporated.

In this case, the effectivity is indicated by placing the framed letter after the new part's index.

Example :  New part.  
120  New index applicable to the nozzle variant 

3rd case - In the concerned zone, one part changes in graphic representation and may embody new components.

In this case, a detail specific to the appropriate effectivity will be placed next to the modified part.

Example :  Old part  
20  Detail  
121 122 123 

4th case - A major change in configuration which cannot be contained within a detailed view.

In this case, a complete sheet is provided for each variant, the effectivity being placed next to the illustration title.

Example : "Inboard Side Wall"

### 3. Restricted Areas

This paragraph defines the structural areas for which the mechanical strength is the essential criterion and to which any damage and repair might affect the useful life of the twin secondary nozzle.

The breakdown of this paragraph is as follows :

Restricted areas of the Twin Secondary Nozzle structure -  
Figures 301 through 305.

Restricted areas in the Secondary Nozzle inner and outer  
stressskin panels - Figures 306 and 307.

#### 4. Inspection Methods

The inspection methods used to assess the condition of the twin secondary nozzle are :

- visual check
- aural check
- radiographic inspection
- dimensional inspection

##### A. Visual check

This check consists in :

visually checking zones with straight-through access using, if required, a binocular (magnifying power : x 10).

visually checking box-type zones through the orifices (ports) provided, using a borescope (see fig. 301).

NOTE : The borescopes currently used at SNECMA for examination of the twin secondary nozzle are :

Rigid borescopes "FORT" with the following characteristics :

- 15 mm (0.590 in.) dia. Direct view
- 15 mm (0.590 in.) dia. 90° Side view
- 15 mm (0.590 in.) dia. 60° Backward view
- 10 mm (0.394 in.) dia. 60° Backward view

Flexible borescopes "OLYMPUS", 11 mm (0.433 in.) dia. Direct view.

This visual check is intended for :

- (1) Ascertaining the condition of the self-locking nuts providing for attachment of the :

- access doors
- convergent panels
- divergent panels
- rear frame heat shield assemblies
- seal plate assemblies
- thermal protections of side walls

- (2) Ascertaining the condition of the various attachment parts such as rivets, bolts, etc... used for assembling the secondary nozzle.

78-13-01

BASIC TWIN SEC. NOZZLE - INSPECTION METHODS

Page 301

Jan 15/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) Ascertaining the condition of components made from stresskin material and more particularly the presence of damage such as : cracks, impacts, tears, wrinkles, wear marks, ...

B. Aural check

This check is carried out by tapping slightly on the stresskin panel, using a small piece of metal, such as a coin.

The purpose of this check is to evidence a core-to-face sheet separation or a deterioration of the internal ribbon.

A panel in good condition emits a clear sound whereas a panel with a deteriorated internal ribbon emits a dull sound

NOTE : This checking method is less efficient in the areas where the stresskin panel contacts a fitting or a structural element and also in the crushed-edge areas of panels.

The aural check is to be applied to all the stresskin panels constituting the inner and outer skins of the secondary nozzle by coin-tapping evenly every 3 or 4 cells.

C. Radiographic inspection using gamma-rays

This inspection is performed using an Iridium 192 radiation source and in accordance with the instructions of chapter 70-20-30, "RADIOGRAPHIC INSPECTION", and as indicated on figure 302.

The purpose of this check is to evidence :

- core-to-face sheet separation or internal ribbon deterioration
- cracks within the stresskin panels or the structural components.

D. Dimensional inspection

Dimensional inspection of the Twin Secondary Nozzle is performed using standard inspection tooling and instrumentation.

78-13-01

BASIC TWIN SEC. NOZZLE - INSPECTION METHODS

Page 302

Jan 15/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

Items to be checked are the following :

- Distance between centres of rear fittings providing for bucket hinge points.
- I.D. of bushings accommodating the bucket trunnion bearings.
- I.D. of housings accommodating the primary nozzle mounting pins.
- I.D. of bushings of the secondary nozzle's attachment links "J", "N", "T" and "R" to nacelle.
- Bores of engine access door lock
- I.D. of bushings provided for upper access door support bracket.
- I.D. of bushings provided for attachment of the bucket pneumatic drive actuator.
- Bores and pins of links provided for barrel support.

## 5. Permissible damage

This paragraph defines the maximum extent of the defects beyond which it is necessary to apply a repair scheme.

The permissible damage are categorized as follows :

- Acceptable damage on the inner and outer skin panels
- Acceptable damage on the main (basic) structure
- Acceptable damage affecting the dimensional characteristics (distortion, wear ...)

### A. Acceptable damage on the inner and outer skin panels

#### (1) Introduction

- (a) Within the damage acceptance limits for the skin panels, two cases are to be considered :

- General case

Zones where the panel provides only for streamlining (covering) or carries minor loads.

- Cases of restricted areas

Zones where the panel transmits heavy loads. and/or wherein the mechanical strength is essential.

NOTE : Restricted areas are defined in paragraph 3.

- (b) Cumulative damage are permissible so long as within an area designated "mesh" and delimited by the frames and stringers (See fig. 301), the unaffected area which separates two successive defects is at least, equal to the most stringent criterion established for the said defects.

- (c) The damage may be adjacent to one or more attachment points provided that acceptance limits for the ineffective attachment points are not exceeded.

NOTE : Restricted areas are defined in paragraph 3.

78-13-01

BASIC TWIN SEC. NOZZLE - PERMISSIBLE DAMAGE

Page 301

Jan 31/77

OLYMPUS 593

MK.610-14-28  
OVERHAUL

(2) Permissible damage

(a) Dents (See figure 302)

CAUTION : IF DENT HAS RESULTED IN A CRACK OR A HOLE, REFER TO ACCEPTANCE LIMITS FOR THESE DEFECTS.

Acceptance limits for the 3 types of dent damage considered are the following :

Case I - Rounded bottom dent, contained within one cell with no collapsing of the panel core ribbon :

- . Max. depth and width of dent to be, respectively, 1 mm (0.04 in.) and equal to 5 times the depth at least.
- . Unaffected area around such defect :  
General case : 45 mm (1.77 in.)  
Restricted areas : 75 mm (2.95 in.)
- . Max. number of this type of dent affecting one (1) "mesh" : 5

Case II - Rounded bottom dent, contained within 3 or 4 cells at maximum, with collapsing of the panel core ribbon.

- . Max. depth and width of dent to be, respectively, 1,5 mm (0.06 in.) and equal to 10 times the depth at least.
- . Unaffected area around such defect :  
General case : 100 mm (3.94 in.)  
Restricted areas : 200 mm (7.87 in.)
- . Max. number of this type of dent affecting one (1) "mesh" : 3

Case III - Large surface dent

These defects are unacceptable. Dents beyond acceptable limits necessitate the repair of panel. The type of repair is determined by the damage extent and location. See chapter REPAIR in the Overhaul Manual.

78-13-01

BASIC TWIN SEC. NOZZLE - PERMISSIBLE DAMAGE

Page 302

Jan 31/77

OLYMPUS 593

MK.610-14-28  
OVERHAUL

NOTE : Dents affecting the outer skin panels and remaining within the acceptance limits, must be masked using an elastomer to reconstitute the panel contour. See REP 29-190-5

- (b) Round bottomed longitudinal crushing (crease)

CAUTION : IF THIS DEFECT SHOWS SHARP EDGES OR HAS INDUCED A CRACK, REFER TO THE ACCEPTANCE LIMITS FOR CRACKS.

This damage is unacceptable.

The type of repair is determined by the damage extent and location. Refer to chapter "REPAIR" of the Overhaul Manual.

- (c) Wrinkles on skin panel face-sheets

CAUTION : IF THIS DEFECT HAS RESULTED IN CRACKING, REFER TO THE ACCEPTANCE LIMITS FOR CRACKS

This damage is unacceptable.

The type of repair is conditioned by the damage extent and location. Refer to chapter "REPAIR" in the Overhaul Manual.

- (d) Delamination (core-to-face sheet separation) or deterioration of core ribbon.

NOTE : Such defects may possibly cause the buckling or bubbling out of plane of the panel face-sheet.

This damage is unacceptable.

The type of repair is conditioned by the damage extent and location. Refer to chapter "REPAIR" in the Overhaul Manual.

- (e) Missing piece of panel face-sheet

This damage is unacceptable.

78-13-01

OLYMPUS 593

MK.610-14-28  
OVERHAUL

The type of repair is conditioned by damage extent and location. Refer to chapter "REPAIR" in the Overhaul Manual.

(e) Missing piece of panel face-sheet

This damage is unacceptable.

The type of repair is conditioned by damage extent and location. Refer to chapter "REPAIR" in the Overhaul Manual.

(f) Cracking

This damage is unacceptable.

The type of repair is determined by the damage extent and location. See chapter "REPAIR" in the Overhaul Manual.

(g) Loss of positive retention at the attachment points (Ref. Figure 303)

This condition may be caused by :

- a missing fastener (rivet, bolt, etc...)
- a loose fastener
- a deteriorated panel in the area of attachment point.

In the case of a missing or loose fastener, re-install a new fastener.

In the case of panel deterioration next to the attachment point, the latter becomes ineffective and the following limits shall apply :

General case (Ref. Figure 303 - Sheet 1)

- Of the two first attachment points located at each end of a row of fasteners, at least one(1) must remain effective.
- In same row, two ineffective attachment points must be separated by two effective ones at least.

Particular case :

The particular cases are defined on Figure 303 (Sheets 2 thru 11)

78-13-01

B. Acceptable damage affecting the nozzle structure (framework)

(1) Introduction

Acceptable damage on the basic structure are categorized per type of parts and as follows :

- Acceptable damage on structural fittings and members (forged, cast or machined-from-solid parts)
- Acceptable damage on sheet metal items
- Acceptable damage on items made from Stressskin panels.
- Acceptable damage on attaching hardware (or fasteners).

Within the acceptance limits for damage affecting the bucket structure, two cases are to be considered :

General case

Zones where the structure carries minor loads

Restricted areas

Zones where the structure carries heavy loads and/or wherein the mechanical strength is essential.

NOTE : The restricted areas are defined in paragraph 3.

(2) Acceptable damage on structural fittings and members

(a) Cracking

Cracks are unacceptable

The type of repair is determined by the crack extent and location. See chapter "REPAIR" in the Overhaul Manual.

(3) Acceptable damage on sheet metal components

(a) Cracking

Cracks are unacceptable

78-13-01

BASIC TWIN SEC. NOZZLE - PERMISSIBLE DAMAGE

Page 320

Jan 31/77

OLYMPUS 593

MK.610-14-28  
OVERHAUL

The type of repair is determined by the crack extent and location. Refer to chapter "REPAIR" of the Overhaul Manual.

(4) Acceptable damage on items from Stressskin panels.

(a) Dents

CAUTION : IF DENT HAS RESULTED IN A CRACK OR A HOLE, REFER TO ACCEPTANCE LIMITS FOR THESE DEFECTS.

Acceptance limits for dents are the following :

Case I : Rounded bottom dent, contained in one cell, with no collapsing of core ribbon.

. Max. depth and width of dent to be respectively, 1 mm (0.04 in.) and equal to 5 times the depth at least.

. Unaffected area around such defects :  
75 mm (2.95 in.)

Case II : Rounded bottom dent, contained in 3 or 4 cells maximum, with collapsing of panel core ribbon.

. Max. depth and width of dent to be respectively, 1,5 mm (0.06 in.) and equal to 10 times the depth at least.

. Unaffected area around this defect :  
200 mm (7.87 in.)

Case III : Large surface dent.

This condition is unacceptable

Dents beyond acceptable limits necessitate the repair of the panel.

The type of repair is determined by the damage extent and location. See chapter "REPAIR" in the Overhaul Manual.

(b) Other types of defects

The following defects are unacceptable :

- longitudinal creasing or wrinkling :
- buckling of panel face-sheet
- delamination or deterioration of panel core ribbon.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- missing piece in panel face-sheet,
- crack evidence.

The type of repair is determined by the damage extent and location. See chapter "REPAIR" in the Overhaul Manual.

- (5) Acceptable damage on the attaching hardware (fasteners).

The fasteners are classified into two categories :

- fasteners retaining panels or removable parts,
- fasteners providing for structural assembly purposes.

- (a) Fasteners for retaining panels of removable parts.

The deterioration of these items is unacceptable. Renew them by applying the following repair schemes :

REP 29-190-1 : Renewal of floating anchor nuts retaining the convergent panels.

REP 29-190-2 : Renewal of floating anchor nuts retaining the divergent panels.

REP 29-190-3 : Renewal of floating anchor nuts retaining the access doors.

REP 29-190-4 : Renewal of floating anchor nuts retaining the rear frame heat shields.

REP 29-190-6 : Renewal of floating anchor nuts retaining the BAC seal.

REP 29-190-7 : Renewal of floating anchor nuts retaining the side wall heat shields.

REP 29-190-10: Replacement of bushings at the bucket pneumatic drive actuator mounting points.

78-13-01

MK. 610-14-28

OVERHAUL

sneema

- (b) Fasteners for structural assembly purposes.  
For these items, two cases are to be considered:

- 1 Case of the accessible fastening items.  
The deterioration of these items is unacceptable. Renew them as instructed in the following repair chapters:

REP 29-190-8 : Repair of barrel suspension links.

REP 29-190-9 : Replacement of defective fasteners on inner and outer shim panels.

REP 29-190-14 : Replacing drain tube.

- 2 Case of the inaccessible fastening items.  
The acceptance limits concerning the loss of such items will be issued later.

- C. Acceptable damage affecting the nozzle dimensional characteristics.

The twin secondary nozzle dimensional characteristics must comply with the following requirements:

- (1) Distance between centres of rear fittings providing for bucket hinge/attachment (See Figure 304 - Sheet 2).
- (a) This check aims at ensuring that the installation of the buckets will be performed under acceptable loads conditions. It is carried out using a micrometer.
- (b) The values "X" measured at each (bucked) hinge arrangement must be included between 1258,6 and 1263,10 mm (49.551 and 49.728 in.).  
Beyond these limits, report to the SNECMA Commercial Product Support.
- (2) Inner diameter of bushes accommodating the bucket trunnion bearings (See Figure 304, Sheet 3).
- (a) The I.D. values must be lower than 47,69 mm (1.8776 in.).

Beyond these values, renew the bushes.

78-13-01

BASIC TWIN SEC.NOZZLE - PERMISSIBLE DAMAGE

Page 323

Jun 30/97

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (3) Inner diameter of bushes for the attachment points to nacelle "J", "N", "T", "R" of the twin secondary nozzle (See Figure 304, Sheet 4).
- (a) I.D. values must be less than :
- |                      |                         |
|----------------------|-------------------------|
| Points "J" and "N" : | 71,445 mm (2.2128 in.). |
| Point "T" :          | 71,445 mm (2.2128 in.). |
| Point "R" :          | 28,628 mm (1.1271 in.). |
- (b) Beyond these values, renew the bushes.
- (4) Inner diameter of bushes accommodating the primary nozzle mounting pins (See Figure 304, Sheet 5).
- (a) The I.D. values must be less than :
- |          |                        |
|----------|------------------------|
| Dia. A : | 64,54 mm (2.5408 in.). |
| Dia. B : | 58,46 mm (2.3016 in.). |
- (b) Beyond these values, renew the bushes.
- (5) Bores providing for lock attachment (See Figure 304, Sheet 5).
- (a) The bores accommodating the pins for lock retention must be less than :
- 7,96 mm (0.3134 in.).
- (b) Beyond this value, report the Direction Après-Vente of SNECMA.
- (6) I.D. of bushes providing for upper access door mounting (See Figure 304, Sheet 5).
- (a) I.D. value shall be less than :
- 7,96 mm (0.3134 in.).
- (b) Beyond this value, renew the bushes.
- (7) Bores providing for mounting of bucket pneumatic drive actuator (See Figure 304, Sheet 6).
- (a) Bore values shall be less than :
- |              |                       |
|--------------|-----------------------|
| location A : | 9,56 mm (0.3764 in.), |
| location B : | 9,56 mm (0.3764 in.), |
| location C : | 6,38 mm (0.2512 in.). |

OVERHAUL

- (b) Beyond these values, renew the bushes.
- (8) Bores and pins of links providing for barrel support  
(See Figure 304, Sheet 7).
  - (a) Value of link bores shall be less than 6,5 mm  
(0.256 in.).  
Pin diameter value shall be higher than 6,3 mm  
(0.248 in.).
  - (b) Beyond these limits, renew deteriorated parts  
according to REP 29-190-8.

## REPAIR

### 1. Format of the repair schemes

Each repair scheme (REP) describes only one operation to be carried out on a single part.

#### A. Repair scheme identification and classification

Any one part is identified by :

- its nomenclature
- its classification in the Illustrated Parts List (Figure-Item)

A repair scheme is identified by :

- the part to which it relates
- the purpose of this repair

These various criteria have been used for identification and classification purposes.

##### (1) Identification

The identification of a repair scheme is given by :

- the nomenclature of the part with its IPL reference No. (Figure-Item)
- the purpose of the repair preceded by its numerical order

##### (2) Classification

The classification of a repair scheme is given by :

- the A.T.A. breakdown system
- the number of the repair scheme which is given by :
  - (a) The part IPL classification (Figure-Item) and the repair numerical order.
- the page number, proper to any repair scheme (re-starts from page 401 for each repair scheme)
- the date

##### (3) Sample of identification and classification

**78-13-01**

FOREWORD

Page 401

FOREWORD

Page 402

May 31/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

NOTE : The REP numbering system uses the repair scheme identification criteria in order to establish the direct identification/classification relationship.

(4) Particular case

(a) Identical parts

When n identical parts are installed on a same assembly, the numbering of the REP will be made by using the IPL classification of the first part.

Example :

Identification of the

thrust reverser cascades : CASCADE (2-10, 11, 30, 31, 50, 51, 70, 90, 110, 111, 130, 150, 170, 190)

REP No. : REP. 2-10-1

(b) Optional parts

In the case of the I.P.L. making mention of optional parts (OPT TO ...) and should these parts require a special repair scheme, the said scheme shall be identified as follows :

- the nomenclature of the part with its IPL reference No. (Figure - Item) of the basic part (and, if required, the manufacturer's part number),
- the purpose of the repair preceded by its numerical order number,  
and classified as follows :
- A.T.A. breakdown system,
- the number of the repair scheme which is given by the IPL classification of the basic part (Figure - Item) and the repair scheme numerical order number followed by an alphabetical variant,
- page numbered 401 and onward,
- the date.

MK.610-14-28

OVERHAUL

## 2. Updating

A. The revisions, entailed by the technical evolution of the repair scheme, will affect its classification only as far as the date is concerned.

B. Modification of the alternate part.

An alpha variant is introduced in the IPL and modifies the figure-item No.

(1) This modification has no effect on the repair scheme :

- the REP remains unchanged

(2) This modification introduces a new REP :

Elaboration of a new repair scheme in which appears the alpha variant issue letter introducing this new REP.

Example : The modification introduces a REP with issue letter C, the previous REP is valid for the parts A and B.

REP 4-20-3 : valid for alpha variant A and B

REP 4-20C-3: valid from alpha variant C.

### REPAIR

#### DEFLECTOR ASSY (1-10/200)

##### 1. Replacing the Cover

---

#### PARTS REQUIRED FOR REPAIR

---

Cover No. 002-004-114-0

Cover No. 002-004-115-0

Rivet T F100° BNAE 21217 CM 4812 (650-024-135-0)

or BNAE 21217 TC 4812 (650-025-135-0)

---

##### A. Disassembly

- (1) Remove the rivets by grinding out their heads.

##### B. Assembly

- (1) Put the cover in position on the deflector and clip it fast (see Fig. 401, Sheet 2).
- (2) Counterdrill, and fit the retaining rivets as instructed in chapter 70-50-10 and shown in Fig. 401.

##### C. Inspection

- (1) Check the riveting as described in chapter 70-50-81.

## REPAIR

ACCESS DOORS (3-10/150/170/190/330/331/350/351/370/371 and  
4-10/30/31/50/51/70/71/100/101).

### 1 Reconditioning the plasma coating

#### PARTS REQUIRED FOR REPAIR

Metallizing powder material P3200

CAUTION : THIS REPAIR SCHEME DOES NOT APPLY TO ACCESS DOORS  
3-10/150/170/190 and 4-70/71/100/101.

#### A. Removing the deteriorated coating

- (1) Strip-off the existing coating using abrasive blasting according to the method M103A of chapter 70-15-20 "CLEANING".

NOTE - 1 - The insert holes must be masked prior to carrying out the abrasive blasting.

2 - Abrasive material to be used is dry corin-  
don 40 (P135).

#### B. Restoring the coating

- (1) Spray the coating in the delineated areas shown on figure 401, as instructed in chapter 70-65-20, "SPRAYING OF COATINGS USING A PLASMA TORCH" and as follows :

The sample test-piece is to be produced from a Stres-  
skin panel material P3700.

Power material sprayed P3200.

Coating thickness 0,1 to 0,15 mm (0.004-0.006 in).

- (2) Carry out a light buffing operation to obtain the sur-  
face finish specified in figure 401.

#### C. Checking the coating

- (1) Check the coating as instructed in chapter 70-65-80  
"INSPECTION OF COATINGS".

NOTE - On the coated areas, the tolerances are  
- 0, + 13 mm (0, + 0.5 in).

REPAIR

## DEFLECTOR ASSEMBLY (1-10)

### 2. Repair of leading edge by means of a welded insert.

---

#### PARTS NECESSARY FOR REPAIR

---

Sheet metal P3325 (NC 20 K 14 x). Thickness : 5 mm (0.197 in.).

Rivet head F100 No. 650-024-135-0

or No. 650-025-135-0.

Filler wire : P 3024.

---

#### A. Removal.

- (1) Remove the deflector cover according to instructions in REP 1-10-1 of this chapter.

#### B. Heat treatment.

- (1) Apply a solution heat treatment to the deflector as specified in method M 832 of chapter 70-45-10.
- (2) Check the treatment in the opening in the foot of the deflector, as specified in chapter 70-45-80.

NOTE : HV  $\leq$  277.

#### C. Preparation of elements to be welded.

- (1) Cut away the damaged area of the blade by electro-discharge machining as indicated in figure 401 and as follows :
  - (a) Cut away at least 5 mm (0.197 in.) around the damaged zone.
  - (b) Grind away the area affected by electric discharge machining to a depth of 0,5 mm (0.020 in.).

OVERHAUL

- (2) From sheet metal P 3325, thickness 5 mm (0.197 in.), make the repair strip as indicated in figure 402 and by the following remarks :

- (a) Machining of sheet metal to follow outline of blade.
- (b) Cutting of strip to shape of area cut away on deflector blade.
- (c) Reworking of edge to be welded into area cut out of deflector blade.

D. Welding of repair strip.

- (1) Chamfer the edges of the parts to be welded as shown in figure 403.
- (2) Position insert strip on deflector blade and argon arc tack weld without filler metal.
- (3) Tack and then weld the run-off tabs in position as shown in figure 403.
  - (a) Welding by argon arc.
  - (b) Class of weld : B 1.
  - (c) Filler metal : P 3024.
- (4) Weld insert strip according to chapter 70-35-10 and the following instructions.

NOTE : Build up weld to allow for later reworking of inserted strip and of weld bead.

- (a) Argon arc welding, successive runs.

NOTE : Alternate welding runs between one part of the deflector blade and another in order reduce deformations.

- (b) Class of weld : B 2.
- (c) Filler metal : P 3024.

78-13-01

REP 1-10-2

Page 402

Jun 15/82

OLYMPUS 593

MK.610-14-28

OVERHAUL

(5) Carry out a class B 2 type weld, check as specified in chapter 70-35-80 and as follows :

- (a) Visual check, binocular magnifier, x 9 magnification.
- (b) Check for crack detection by post emulsification fluorescent penetrant according to method M 504 B of chapter 70-20-10.
- (c) Radiographic check of weld bead according to chapter 70-20-30.

(6) Remove run-off tabs by grinding and deburr.

E. Heat treatment.

(1) Apply heat treatment to the deflector in this state as indicated in chapter 70-45-00 and by the following operations :

- (a) Tempering according to method M 807.
- (b) Tempering according to method M 808.

(2) Check heat treatment in the opening of the foot and around the insert strip mentioned in figure 403 and as specified in chapter 70-45-80.

Hardness should be : BHN from 300 to 385 after heat treatments.

F. Reforming

- (1) Check flatness of deflector blade, as indicated in figure 404.
- (2) Reform if necessary.

G. Machining of blade.

- (1) Remove the build up of material from the insert strip as shown in figure 404.
  - (a) Level the weld seam to the level of the sides of the deflector blade.
  - (b) Level off the build up from insert strip.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Machine the leading edge of the blade as indicated in figure 404 and according to chapter 70-55-00.

- (a) Radiusing of blade angles.
- (b) Chamfering of leading edges.
  - 1 Rough machine by milling.
  - 2 Finish by grinding.

- (c) Radiusing of corners of leading edge.

#### H. Heat treatment.

- (1) Apply a stress relieving treatment to the deflector as specified in method M 808, chapter 70-45-10.

NOTE : Soak time : 4 hours.

- (2) Check heat treatment in the opening in the foot in accordance with chapter 70-45-80.

Hardness should be : BHN from 300 to 385.

#### I. Dimensional check of parts.

- (1) Mount the part on the test apparatus SC 318 as shown in figure 405 and indicated in the following instructions :

- (a) Rest the surface "B" of the blade on the studs.
- (b) Rest surface "A" of footing against the two feelers.

NOTE : The two feelers represent the generating line produced by the intersection of planes "A" and "B".

- (c) Rest the part against the stop.
  - (d) Immobilise the deflector in this position by means of the three clamps.
- (2) Check the dimensions of the deflector as shown in figure 405 and indicated in the following instructions :

78-13-01

REP 1-10-2

Page 404

Jun 15/82

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (a) Check outline of the blade as shown in figure 405 sheet 1 using standard 3 mm (0.118 in.) shims at the points marked \*.
- (b) Check the footing by checking surface "A" using the templates and standard 3 mm (0.118 in.) shims according to figure 405 sheet 2.

1 When the 3 mm (0.118 in.) shim is in position between the template and the lug, the clearance between the template and the footing must be between 0,15 and 0,60 mm (0.0060 to 0.024 in.).

- (c) Check blade positioning with a micrometric comparator as shown in figure 405 sheet 2 and according to the following procedure :

1 Zero comparator at standard.

2 Check position of the blade on the whole length by moving comparator along the slide.

NOTE : Thickness of the blade in the area checked : 5,33 mm (0.2100 in.).

#### J. Reworking.

- (1) If necessary, reform the deflector footing in a press, taking into account the flatness of surface "B" of the blade.

- (2) Check the reshaping as indicated in I.

#### K. Polishing.

- (1) Polish the 2 sides of the blade along the full length of the post as shown in figure 406 and according to the following conditions :

(a) Rough with emery cloth P 547, grade 80, and then grade 180.

(b) Finish with paste P 266.

NOTE : Roughness : 1,6 Ra (0.063).

OLYMPUS 593

MK.610-14-28

OVERHAUL

L. Peening.

- (1) Apply a steel ball peening operation to all sides of the deflector, except for surface "A" of the footing and the opening, according to method M 312 C of chapter 70-15-30 and the following information :

(a) Steel ball peening, steel shot 315 (S 62).

(b) Intensity : F 15A à F 23A.

M. Installation.

- (1) Replace the cover on the deflector as specified in REP 1-10-1 of this chapter.

N. Marking.

- (1) Following the part number mark "REP 2", according to method M 28 of chapter 70-10-20.

NOTE : Neutralise electrolyte action as quickly as possible.

---

A. Removing the Damaged Insert

- (1) Remove the insert by grinding out or drilling the crimping as shown on Figure 401.

CAUTION : TAKE CARE TO PROTECT THE STRESSKIN PANEL  
TO AVOID ANY DETERIORATION OR BURNING AS  
A RESULT OF THE GRINDING OPERATION.

MK.610-14-28  
OVERHAUL

## B. Preparing the Components

- (1) Depending on the type of insert to be renewed, produce a bush as indicated on figure 402.
- (2) Rework the inserts and the crimping rings as indicated on figure 403.

## C. Fitting the Bushes

- (1) Perpendicular to the tangent plane of the door, ream the hole which accommodate the bush as indicated in figure 404.
  - (a) The hole location is determined using a drilling template as specified on figure 407.
  - (b) The drilling operation is carried out by means of a pilot-end milling cutter as instructed in the Standard Practices, chapter 70-30-10 and on figure 404.
- (2) After machining, visually check for cracks perpendicular to the hole, using a binocular with a tenfold magnifying power.

No crack is permissible. If any crack is found, set the part aside pending a repair scheme to come.

- (3) Fit the bush as follows :
  - (a) Locate the bush, making sure that it is perpendicular to the access door outer contour.
  - (b) Tackweld in position then, argon arc weld the bush to the access door as instructed in the Standard Practices Manual, chapters 70-30-10 and 70-35-10 and in figure 404.

OVERHAUL

NOTE : The panel shall be argon-purged for one (1) hour prior to the welding operation. When welding, protect the panel all around the bush by means of copper heat-sink (heat removing) blocks.

(c) Test the weld, class B1, for soundness as instructed in the Standard Practices Manual, chapter 70-35-80.

1 Inspect locally, using the water-washable dye penetrant process M 501 B in chapter 70-20-10.

(d) Grind the welds flush with the adjacent contour and machine the bushes as indicated in figure 404, sheet 2.

(e) Chamfer and deburr the bushes.

#### D. Fitting the Inserts

(1) Install the inserts as shown in figures 405 and 406.

(2) Crimp the inserts using the tool SC 253 and as shown in figure 405, sheet 2.

#### E. Inspection

(1) Ensure that the insert does not work around in its recess.

(2) Check that the inserts fully contact the panel and inspect the crimping as indicated in figure 408.

Spacer No. 002-003-992-1  
Washer No. 649-786-229-0

## A. Introduction

In this repair scheme, three cases are considered :

- (1) Crack repair in accordance with para. B.
- (2) Repair of impacts (nicks/dents) in accordance with para. C.
- (3) Repair of delaminations in accordance with para. D.

### B. Crack repair

- (1) Restrictions on repair.
  - (a) The crack must not lie in a delaminated zone. Perform an aural check (tap coin test) to ensure there is no delamination.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

(2) Repair instructions

- (a) Using a X 20 power binocular eye-piece, accurately demarcate the crack then, stop-drill both ends of crack by a 2,5 mm (0.098 in.) dia. hole.
- (b) Argon arc weld fill the crack as prescribed in chapter 70-30-10 "PRINCIPLES FOR REPAIRING COMPONENTS MANUFACTURED FROM WELDED HONEYCOMB MATERIAL" and 70-35-10 "WELDING BY FUSION" (Ref. Fig. 401).

Filler welding wire P 3008 or P 3030  
Weld class B1

NOTE : During the welding operation, it is essential that copper heat-sink blocks (cooling blocks) be placed as close as possible the zone being welded (Fig. 401).

(3) Inspection

Inspect the weld, class B1, as prescribed in chapter 70-35-80 "INSPECTION OF WELDS".

Locally check for cracks by the water-washable dye penetrant test, method M 501 B in chapter 70-20-10.

CAUTION : THE PENETRANT IS TO BE CLEARED OUT USING A CLOTH SOAKED WITH ISOPROPYL ALCOHOL (P 442).

C. Repair of impacts (nicks/dents)

(1) Restrictions on repairs

- (a) Using a X 20 power binocular eye-piece, check that impacts are free from cracks.
- (b) Tap coin test to ascertain there is no delamination within the area to be repaired.

(2) Repair instructions

- (a) Recondition the contour of access doors using silicone elastomer CAF 4 (P 474) adhering to the instructions of method M 701 described in chapter 70-31-20 "APPLICATION OF RESINS AND ELASTOMERS" and as instructed hereafter :

78-13-01

REP 3-10-4

Page 402

Sep 30/78

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- 1 Prepare the repair area by sanding with an emery cloth.
- 2 Degrease the repair area using a cloth soaked with trichloroethylene (P 76A).

- (b) After polymerization of elastomer, smooth the surface discontinuities by sanding with emery cloth if necessary.

#### D. Repair of delaminations

##### (1) Restrictions on repairs

- (a) The delamination must not be combined with a crack or an impact.  
Check for cracks using X 20 power binocular eyepiece.
- (b) The shaded zones shown on figure 402 can not accommodate delamination restraining bolts.

##### (2) Repair instructions

- (a) Using a very fine grain abrasive paper, sand lightly the panel until the cell pattern shows up in the area under repair.
- (b) Mark the locations of stiffening points as specified in figure 402.
  - 1 When a delamination is adjacent to an angle piece or a fillet, mark the stiffening points in compliance with the conditions stated in figure 402.
  - 2 Where the stiffener zone is involved, remove the stiffener per REP 3-10-2.
- (c) Drill passage holes for HI-LOCK screws as instructed in chapter 70-50-40 "JOINTS MADE BY MEANS OF HI-LOCK FIXINGS".
- (d) Drill recess holes for spacers in the delamination zone as indicated in figure 402.

78-13-01

REP 3-10-4

Page 403

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (e) Measure and record the effective value of depth "E" for spacer recess holes in accordance with figure 402.
- (f) Machine spacers from bar P 3601 to the dimensions specified in figure 402.

NOTE : The value  $L = "E" - 0,2 \text{ mm (0.008 in.)}$  for the length of spacers is required to allow for a pre-stress condition upon the installation of HI-LOCK screws.

- (g) Install the spacers and hold them fast into their recess using bonding agent LOCTITE 307 (P 502).
- (h) Install the stiffening attachments as indicated in figure 402 and as instructed in chapter "RIVETING" section 70-50-40.

NOTE : When fitting the washer, the radiused face must contact the stressskin panel.

- (j) If it has been necessary to remove the stiffener to carry out the repair, re-install it as prescribed in REP 3-10-2.

(3) Inspection

Inspect the HI-LOCK screw fixings as instructed in chapter "RIVETING", section 70-50-84.

---

#### A. Removing Damaged Seal Elements

- (1) Remove rivets securing damaged seal element by grinding out the heads without impairing the reinforcement plates.

#### B. Installing New Seal Elements

- (1) Check diameter of rivet holes as directed in chapter "RIVETING", section 70-50-10.
- (2) Fit new elements and rivet, as instructed in chapter "RIVETING", section 70-50-10 and in figure 401.

CAUTION : WHEN USING RIVETS BNAE 21215 TC 4008, THEIR HEADS ARE TO BE REWORKED AS INDICATED IN FIGURE 401.

- (3) Check riveting as directed in chapter "RIVETING", section 70-50-80.

## A. Disassembly

- (1) Remove damaged elements by grinding out the rivet heads as instructed in Chapter "RIVETING" and figure 401.

## B. Mounting new elements

This can be done in three ways :

- (1) Applying a reinforcing strip

- (a) Mark out the locations of the fasteners as shown in figure 401

78-13-01

REP 5-260-1

Page 401

Apr 30/93

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (b) Drill pilot of 2 mm (0.08 in.) dia. at the fixing points.
- (c) Put the edge reinforcing strip in position and pin it on. Insert shims 1,2 mm (0.047 in.) in thickness between strip and shield.
- (d) Drill out and apply rivets as instructed in Chapter "Riveting" and figure 401.

NOTE : Remember to fit washers between reinforcing strip and heat shield.

- (2) Applying shims as per views F1 and F5.
  - (a) Locate and fasten on the shims.
  - (b) Apply the fixing rivets as instructed in Chapter "RIVETING" Section 70-50-10, and in figure 401.
  - (c) Machine-flush the rivet heads.
  - (d) Shape the shims to the shield contour as instructed in figure 401.
- (3) Applying bolt supports and stiffeners.
  - (a) Put the new elements in position on the shield, as shown in figure 401.
  - (b) Counterdrill the retaining holes.
  - (c) Apply the rivets, not omitting to fit the HI-LOK bolts, and washers underneath the rivet heads, as instructed in Chapter "RIVETING", Section 70-50-10, and in figure 401.
  - (d) Machine flush the shim rivet heads marked ● and ○ in figure 401.

#### C. Inspection

- (1) Check the riveting as instructed in Chapter "RIVETING", Section 70-50-81. "Inspection of solid rivets".

Filler weld wire P 3028 (NCK 20 D)

---

**A. Introduction**

In this repair scheme two types of action are applicable.

- (1) Filler welding as per paragraph B when crack length is smaller than or equal to 25 mm (0.098 in).
- (2) Filler welding as per paragraph C when crack length is greater than 25 m (0.098 in).

**B. Crack filler welding when crack length is smaller than 25 mm (0.098 in).**

- (1) If necessary, remove the riveted elements as instructed in REP 5-260-1.

NOTE : Retain the plain washers and HI-LOCK bolts.

- (2) Argon arc-weld the cracks as instructed in chapter 70-35-10.

(a) Filler weld wire : P 3028 (NCK 20 D).

(b) Class of weld : B1.

**78-13-01**

REP 5-260-2

MK.610-14-28  
OVERHAUL

(3) Inspect class B1 welds as instructed in chapter 70-35-80.

(a) Perform local dye penetrant inspection using fluorescent water-washable product as per method M 502 B, chapter 70-20-10.

(4) If applicable, machine flush the weld in the zones in contact with the riveted elements.

(5) Re-install the riveted elements and check for correct installation as per REP 5-260-1.

C. Crack filler welding when crack length is greater than 25 mm (0.098 in)

(1) Remove all the riveted items as per REP 5-260-1.

NOTE : Retain the plain washers and HI-LOCK bolts.

(2) Filler weld the cracks as per paragraph B (2), (3) and (4) of this repair scheme.

(3) Carry out a heat treatment of the shield as per method M 812 in chapter 70-45-10.

(a) Treatment at 800°C for 8 hours and cooling in still air.

(4) Re-install all the riveted elements and check for correct installation as per REP 5-260-1.

---

## A. Removal

- (1) Remove the reinforcing strip after removing the rivets as per REP 5-260-1.

## B. Metal spraying

- (1) Metal spray the worn areas of the shields as per figure 401, chapter 70-65-20 and following instructions :

- (a) Sprayed powder : P 3205

- (b) Coating thickness : as required.

NOTE 1 : Test pieces used prior to metal spraying on parts are made of sheet metal P 3328 (NC 22 FeD), test piece dimensions are given in chapter 70-65-20.

NOTE 2 : The master test-piece is made of 4 mm (0.157 in) - thick sheet metal P 3326 (NCK 20 D).

- - (2) Inspect the coating as per chapter 70-65-80.
  - (3) Slightly buff the part so as to obtain the surface condition specified in figure 401.

REPAIR

PINS (8-10/140/270/400/530)

1. Replacement of the Sleeve.

---

PARTS REQUIRED FOR REPAIR

---

Sleeve	300-855-800-6
--------	---------------

---

A. Removal of the Damaged Sleeve. Refer to figure 401.

- (1) Remove the spherical end stop using a pin wrench.
- (2) Install the pin on a lathe as follows:
  - (a) Tighten in soft jaws on diameter A: 64,476 mm (2.5384 in.).
  - (b) Install a 90° tail stock at the end of the pin.
  - (c) Set to obtain a concentricity of diameter C relative to diameter A within 0,025 mm (0.0010 in.) maxi.
- (3) Remove the sleeve by turning per chapter 70-55-10 of Standard Practices, taking care not to damage the pin.

NOTE: Pin material: KC20WNa (HS25)

B. Visual Inspection of Parts.

- (1) Check for the good condition of silver plating on the spherical end stop thread.

If necessary, recondition per REP 8-110-1.

- (2) Check that the sleeve mating face on the pin is free of scratch and surface defects.

In case of evidence of defect, remove defect by lapping within dimensional of diameter D.

**78-13-01**

REP 8-10-1

Page 401

OVERHAUL

C. Fluorescent Penetrant Inspection of Parts.

- (1) Perform a water washable fluorescent penetrant test of the spherical end stop by method M502B of chapter 70-20-10.

No crack allowed.

- (2) Perform a water washable fluorescent penetrant test of the sleeve mating face of the pin (diameter D) by method M504B of chapter 72-20-10.

No crack allowed.

D. Dimensional Inspection.

- (1) Check that diameter D is superior to 26,94 mm (1.0606 in.).

If diameter is lower than this value, store the part for a futur repair.

E. Installation of a New Sleeve on the Pin.

- (1) Make sure that the parts are clean.

If necessary clean the parts with a clean cloth moisted with solvent P325 (Acetone) or P422 (Methylethylketone).

- (2) Chill the pin in liquid nitrogen.
- (3) Position the sleeve, chamfered side first on the pin and fit until abutment.

F. Machining of Sleeve. Refer to figure 402.

- (1) Install the pin assembly on a grinding machine as follows:

- (a) Tighten in soft jaws on diameter A: 64,476 mm (2.5384 in.).
- (b) Install a 90° tail stock at the end of the pin.
- (c) Set to obtain a concentricity of diameter C relative to diameter A within 0,025 mm (0.0010 in.) maxi.

OVERHAUL

- (2) Grind the outer diameter, Dia B, of the sleeve per figure 402.

NOTE: Sleeve material: KC20WNx (HS25).

- G. Clean the Pin per Method M100A of Chapter 70-15-20.
- H. Perform a water washable fluorescent penetrant test of the sleeve by method M501B of chapter 72-20-10.
- No crack allowed.
- I. Install the Spherical End Stop as Follows.
- (1) Lightly coat the thread with oil P194 (lanoline).
- (2) Install the spherical end stop in the pin. Tighten using a pin wrench. Torque to 2,6-2,9 daN.m. (19-21 lb.ft).

CUP WASHER ASSY (8-100/230/360/490/600)

1. Renewing the crimped nut

---

PARTS REQUIRED FOR REPAIR

---

Nut No. 649-784-031-0

---

A. Removing the damaged crimped nut

- (1) Using a 60° relief angle milling cutter fitted on a hand drill, machine the crimped flange (collar) of the nut. When the flange is sufficiently thinned, the nut can be driven out.

NOTE : It is recommended not to machine the flange entirely in order to avoid damage to the crimping recess.

B. Installing the new crimped nut

- (1) Install a new nut using the crimping tool SC 234 and shown on figure 401.

C. Checking the crimping

- (1) Ensure that :

The nut skirt is recessed relative to the part abutment face.

The skirt is not cracked. Otherwise, fit a new nut.

The nut can be moved axially by a few tenths of a millimeter; refer to figure 401.

## A. Replacement of rivets A and B

- (1) Remove damaged blind rivets as instructed in chapter "RIVETING", Section 70-50-50.
- (2)
  - (a) Inspect the rivet holes as described in chapter "RIVETING", Section 70-50-50.
  - (b) If necessary, make holes for repair-size rivets.
- (3) Apply new blind rivets as instructed in chapter "RIVETING", Section 70-50-50, "Joints Made by the Use of CHERRY-LOCK Blind Rivets", and in figure 401.

**78-13-01**

REP 9-10-1

OVERHAUL

- (4) Check the riveting as described in chapter "RIVETING" Section 70-50-85.

B. Replacement of pins and welded washers.

- (1) Remove the damaged fasteners of doublers by grinding or drilling on welded washer side.
- (2) Fit new pins and washers as follows :
  - (a) Place the pin and washer in their recesses as shown in figure 401.
  - (b) Exert a force of 45 daN (100 lbs) on the washer, and argon arc-weld it onto the pin as instructed in chapter "WELDING", Section 70-35-10 "Welding by Fusion".  
  
Weld filler wire P3002 (Z 3 CN 18)  
Weld class B1
- (3) Machine down the excess pin portion flush with the washer, without damaging the weld.
- (4) Carry out inspection of the Class B1 weld as described in chapter "WELDING", Section 70-35-80.

C. Replacement of reinforcement plates and doublers

- (1) Remove the fasteners of reinforcement plates and doublers as instructed under A and B in this repair scheme description and in figure 401.
- (2) Apply identifying marks to the retaining holes by the following procedure :
  - (a) Stick strips of STABYLENE bracing paper on the side fairing.
  - (b) Mark the retaining holes.
  - (c) Position the reinforcement plates or doublers on the side fairing as indicated in figure 401.
  - (d) Stick the STABYLENE strips on the reinforcement plates, and take down.
- (3) Drill the appropriate doubler and reinforcement plate retaining holes in the side fairing.

OLYMPUS 593

## A. Introduction

In this repair scheme, three cases are considered :

- (1) Crack repair in accordance with para. B.
- (2) Repair of impacts (nicks/dents) in accordance with para. C.
- (3) Repair of delamination in accordance with para. D.

**78-13-01**

REP 9-10-2

Page 401

Apr 30/93

OLYMPUS 593

MK.610-14-28  
OVERHAUL

## B. Crack repair

### (1) Restrictions on repair

- (a) Crack to be no longer than 100 mm (4 in.).
- (b) The sound area surrounding the repair must span 100 mm (4 in.) minimum.
- (c) The crack must not lie in a delaminated zone.  
Aurally check (tap coin test) to ensure there is no delamination.  
The non-compliance with one of these prerequisites should not permit to carry out the repair.

### (2) Repair instructions

- (a) Using a X 20 power binocular eye-piece, accurately demarcate the crack then, stop-drill either ends of crack by a 2,5 mm (0.098 in.) dia. hole.
- (b) Argon arc weld fill the crack as instructed in chapters 70-30-10 and 70-35-10.  
Filler welding wire : P 3008 or P 3030.  
Weld class : B1.

NOTE : During the welding operation, it is essential that copper heat-sink blocks (cooling blocks) be placed as close as possible the zone being welded (See fig. 401).

### (3) Inspection

Inspect the weld class B1 as instructed in chapter 70-35-80.

- Locally check for cracks by the water-washable dye penetrant test, method M 501 B in chapter 70-20-10.

CAUTION : THE PENETRANT IS TO BE CLEARED OUT USING A CLOTH SOAKED WITH ISOPROPYL ALCOHOL (P 442).

78-13-01

REP 9-10-2

Page 402

Sep 30/78

OLYMPUS 593

MK.610-14-28

OVERHAUL

C. Repair of impacts (nicks/dents)

(1) Restrictions on repair

- (a) Using a X 20 power binocular eye-piece, check that the area to be repaired is free from cracks.
- (b) Tap coin test to ascertain there is no delamination.

Do not carry out the repair if one of the above defects is present.

(2) Repair instructions

- (a) Recondition the contour of the rear side fairing using CAF 4 Silicone Elastomer (P 474), per method M 701 in chapter 70-31-20 and as indicated below :
  - 1. Degrease the area under repair with a cloth soaked with trichloroethylene (P 76 A).
  - 2. Prepare the repair area by sanding with an emery cloth.
- (b) After polymerization of elastomer, if required, smooth the surface discontinuities by sanding with an emery cloth.

D. Repair of delaminations

(1) Restrictions on repair

- (a) Using a X 20 power binocular eye-piece, check for cracks in the area under repair.
- (b) Ensure there is no impact in same area.
- (c) Repairs can not be carried out in the shaded zones defined on figure 402.

The non-compliance with one of these criteria should not permit this kind of repair.

(2) Repair instructions

- (a) Using a very fine grain abrasive paper, lightly sand the panel until the cell pattern shows up in the area under repair.

78-13-01

REP 9-10-2

Page 403

Sep 30/78

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Mark the locations of the stiffening points as indicated in figure 402.

When a delamination lies next to the doublers or a fillet, mark the stiffening points per the conditions stated in figure 402.

- (c) Drill the passage holes for the HI-LOCK screws as instructed in chapter 70-50-40 and per figure 402.
- (d) In the delamination zone, drill the recess holes for the spacers to the dimensions indicated on figure 402.
- (e) Measure and record the effective value of depth "E" for the spacer recess holes in accordance with figure 402.
- (f) Machine the spacers from stock material P 3601 to the dimensions specified in figure 402.

NOTE : The value  $L = "E" - 0,2 \text{ mm (0.008 in.)}$  for the length of spacers is required to allow for a pre-stress condition upon the installation of HI-LOCK screws.

- (g) If necessary, machine thrust washers from stock material P 3601, as per figure 402 (Sheet 5 of 5).

NOTE : The alpha angle is that largest slope angle relative to the abutment face of HI-LOCK self-locking nut.

- (h) Locate the spacers in their recess and hold them in place using bonding agent LOCTITE 307 (P 502).
- (j) Install the stiffening attachments as indicated in figure 402 and instructed in chapter 70-50-40.

NOTE : When fitting the thrust washer, position it so that its radiused face contacts the stressskin panel.

### (3) Inspection

Inspect the HI-LOCK screw fixings as instructed in chapter 70-50-84.

REPAIR

HEAT SHIELD (9-530/580/630/680)

1. Replacing the floating nuts

PARTS TO BE REPAIRED

Floating nut	SIMMONDS LA 579-3	(649-302-008-0)
Floating nut	SPS 13716-02-3	(649-785-195-0)
Rivet	BNAE 21217TC2406	(650-025-042-0)
or	BNAE 21217TC3207	(650-025-073-0)

A. Disassembly

- (1) Loosen out the defective nut by grinding out the rivet heads.
- (2) Check the rivet holes as instructed under 70-50-10, chapter "Riveting".

Where called for, rebore the rivet holes on assembly to the next larger diameter as instructed under 70-50-10, chapter "Riveting".

B. Assembly

- (1) Put a new nut in place on the heat shield, then apply to retaining rivets as instructed under 70-50-10, chapter "Riveting" and in Fig. 401.

C. Inspection

- (1) Check the riveting as instructed under 70-50-81, chapter "Riveting".

## REPAIR

CONVERGENT PANEL ASSY (11-10/40/70/100)1. Renewing the insertsPARTS REQUIRED FOR REPAIR

Insert	649-773-095-0
Insert	649-773-140-0
Hollow rod material P 3621	
Filler welding wire P 3008	

## A. Removing the damaged insert

- (1) Remove the insert by grinding out its flared end as indicated on figure 401.

CAUTION : TAKE CARE TO PROTECT THE STRESSKIN PANEL TO AVOID ANY DETERIORATION OR BURNING AS A RESULT OF THE GRINDING OPERATION.

## B. Preparing the components

- (1) Depending on the type of insert to be renewed, produce a bush as indicated on figure 402.

## C. Installing the insert

- (1) Perpendicular to the insert to be renewed, drill a hole to accommodate the bush.  
The hole location is determined using a drilling template, the ref. No. of which is given on figure 404.

Drilling of hole is carried out using an end mill cutter as instructed in chapter 70-30-10 "PRINCIPLES FOR REPAIRING COMPONENTS MANUFACTURED FROM WELDED HONEY-COMB MATERIAL" and as shown on figure 403.

- (2) After machining, visually check for cracks using a binocular with a tenfold magnifying power.

No crack is permissible. Should one be found, put the part aside pending a repair scheme.

(3) To fit the bush, operate as follows :

- (a) Place the bush in position, making sure that it is perpendicular to the panel internal contour.
- (b) Tackweld, then argon arc weld the bush to the converging panel as instructed in chapter 70-35-10 "WELDING BY FUSION" and in chapter 70-30-10 "PRINCIPLES FOR REPAIRING COMPONENTS MANUFACTURED FROM WELDED HONEYCOMB MATERIAL".

Filler welding wire P 3008  
Class of weld B1

NOTE : The panel must be argon-purged for one (1) hour prior to carrying out the welding.  
During the welding operation, protect the panel around the bush using copper heat-sink blocks.

- (c) Inspect the weld, class B1, for soundness as instructed in chapter 70-35-80 "INSPECTION OF WELDS".
  - (d) Grind the weld seam flush with the profile of dimpling (see figure 403).
- (4) Locate the insert in position and crimp it using tool SC 253 as shown on figure 404.
- (5) Check that the insert does not rotate or otherwise move in its recess.

## REPAIR

### CONVERGENT PANEL ASSY (11-10/40/70/100)

#### 2. Reconditioning the plasma coating

---

##### PARTS REQUIRED FOR REPAIR

---

Metallizing powder material P 3200

---

##### A. Removing the deteriorated coating

- (1) Strip-off the existing coating using abrasive blasting according to the method M 103 A of chapter 70-15-20 "CLEANING".

NOTE 1 : The insert holes must be masked prior to carrying out the abrasive blasting.

2 : Abrasive material to be used is dry corindon 40 (P 135).

##### B. Restoring the coating

- (1) Spray the coating in the areas outlined on figure 401 as instructed in chapter 70-65-20 "SPRAYING OF COATINGS USING A PLASMA TORCH" and as follows :

The sample test-piece is to be produced from a Stress-skin panel material P 3700.

Sprayed powder material P 3200.

Coating thickness : 0,1 to 0,15 mm (0.004 - 0.006 in)

- (2) Carry out a light buffing operation to obtain the surface finish specified on figure 401.

##### C. Checking the coating

- (1) Check the coating as instructed in chapter 70-65-80 "INSPECTION OF COATINGS"

NOTE : On the coated areas, the tolerances are  
- 0 + 13 mm (0 + 0.5 in.)

---

A. Introduction

This repair scheme covers three types of repair, namely :

- (1) Repair of cracks (heading B)
- (2) Repair of impact marks (heading C)
- (3) Repair of delaminations (heading D)

B. Repair of cracks

(1) Restrictions on repair

- (a) The crack must not exceed 100 mm (4 in) in length.
- (b) The sound area around the site of repair must be 100 mm (4 in).
- (c) The crack must not lie in a delaminated area. Freedom from delamination is to be ascertained by a tapping test using a metal coin.

(2) Repair instructions

- (a) Precisely demarcate the crack with the aid of a X20 twin-lens magnifier, and drill a 2,5 mm (0.10 in) dia. hole at its either end.

**78-13-01**

REP 11-10-3

Page 401

Jan 31/81

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Argon-arc weld fill the crack, following the instructions in chapters 70-30-10 "REPAIR OF WELDED HONEYCOMB STRUCTURES" and 70-35-10 "WELDING" (see Fig. 401).

Filler metal P3008 or P3030

Weld class B1

NOTE : While welding, it is essential to use copper cooling blocks placed as near to the site of welding as possible (see Fig. 401).

(3) Inspection

Perform a class B1 weld inspection as instructed in chapter 70-35-80 "WELDING" ; next a water washable dye penetrant test by method M 501 B, chapter 70-20-10.

CAUTION : THE PENETRANT IS TO BE CLEARED OUT WITH A CLOTH STEEPED IN ISOPROPYL ALCOHOL (P442).

C. Repair of impact marks

(1) Restrictions on repair

- (a) Use a X20 twin-lens magnifier to ascertain that the impact has produced no crack.
- (b) Do a tapping test with a coin to check that the area under repair is free from delamination.
- (c) Puncture of the skin through impact is admissible if limited to a single cell.

(2) Readyng the site of repair

- (a) Rub the area under repair with a fine emery cloth.
- (b) Cleanse the surface to be welded with a pad dipped in isopropyl alcohol (P442).

If the panel is punctured, repeat several times over.

78-13-01

REP 11-10-3

Page 402

OVERHAUL

### (3) Repair instructions

NOTE : While welding, it is essential to use copper cooling blocks placed as near to the site of welding as possible.

- (a) An impact mark whose area is limited to a single cell is repaired by argon-arc weld filling, as per instructions in chapters 70-35-10 "WELDING" and 70-30-10 "REPAIR OF WELDED HONEYCOMB STRUCTURES", and Fig. 402, sheet 1.

Filler metal P3030 or P3008

Weld class B1

- (b) An impact mark not exceeding 5 sq.cm (0.78sq.in) in area is repaired as follows :

- Machine a washer out of sheeting P3305, intended to stop up the hollow made by the impact.
- Argon arc weld the washer as instructed in chapters 70-35-10 "WELDING" and 70-30-10 "REPAIR OF HONEYCOMB STRUCTURES" and shown in Fig. 402, sheet 2.

Filler metal 3008 or P3030

Weld class B1

NOTE : Weld on the washer first by its central hole then round its entire circumference (see Fig 402).

### (4) Inspection

- (a) Perform a class B1 weld inspection as instructed in chapter 70-35-10 "WELDING".

Locally applied water washable dye penetrant test by method M 501 B, chapter 70-20-10.

- (b) Check that the repaired segment is free from delamination (tapping test with a coin).

78-13-01

REP 11-10-3

Page 403

OVERHAUL

D. Repair of delaminations

(1) Restrictions on repair

- (a) Use a X20 twin lens magnifier to ascertain that the delaminated surface is free from cracks.
- (b) The core-to-face sheet separation must not be compounded by impact marks.

In case of either cracks or impact marks, this type of repair is ruled out.

(2) Repair instructions

- (a) Lightly sandpaper the panel with extra-fine abrasive for the cellular pattern to show up in the area under repair.
- (b) Location mark the points of reinforcement.  
  
Where a delamination is adjacent to a blending radius, mark the reinforced points in the mode of installation shown in Fig. 403.
- (c) Drill the Hi-Lock screw holes as marked out, and as described in chapter 70-50-40 "RIVETING".
- (d) Drill the spacer accommodating holes in the delaminated area to the dimensions specified in Fig. 403.
- (e) Measure the actual spacer hole depth "E" as indicated in Fig. 403.
- (f) Prepare spacers out of bar P3601 in the size specified in Fig. 403.

NOTE : Spacer length L = "E" of 0.2 mm (0.008 in) is required to ensure a prestressing margin for the mounting of the Hi-Lock screws.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (g) Fit the spacers and secure them in their holes with LOCTITE 307 glue (P502).
- (h) Apply the reinforcing fasteners as shown in Fig. 403 and instructed in chapter 70-50-40 "RIVETING".

NOTE : When placing the thin washer, its rounded edged face must be in contact with the stressskin panel.

(3) Inspection

Check the HI-LOCK screws for proper fit as described in chapter 70-50-84 "RIVETING".

## REPAIR

### DIVERGENT PANELS (12-10/13-10/13-120/14-10) Variant B

#### 1. Renewing Crimped Washers

---

#### PARTS REQUIRED FOR REPAIR

---

Crimping washer	No. 302-017-501-0
Crimping washer	No. 302-020-700-0
Washer	No. 302-019-200-0

---

#### A. Removal

- (1) Remove damaged crimped washers by grinding the bits of crimping come undone, as indicated in figure 401.

#### B. Inspection Checks

- (1) Make sure that the housing and bearing face of the crimping washer is thoroughly clean.
- (2) Perform a water-washable dye penetrant test at the crimped-washer locations, employing method M 501 B as described in chapter "PENETRANT INSPECTION", section 70-20-10.

Cracks are not admissible.

#### C. Installing New Washers

- (1) Fit new washers as indicated in figure 402.
- (2) Crimp the crimping washer around its periphery, in the way indicated in figure 402, using a punch with a 100° angle.

#### D. Checking the Crimping

- (1) Ascertain that :
  - (a) The crimped washers do not turn or shift in their housings.

PARTS REQUIRED FOR REPAIR

- A. Recondition the silverplating of the conical flange bores in accordance with the instructions on Method M 303 B a) in chapter 70-15-30 : "SURFACE TREATMENT METHODS", and the indications in figure 401, observing the following points :
- (1) The damaged silverplating is to be stripped off by Method M 109 A described in chapter 70-15-20 : "CLEANING METHODS".
  - (2) Check for cracks by the water-washable fluorescent penetrant process using Method M 102 B described in chapter 70-20-10 : "PENETRANT INSPECTION".
  - (3) Plating thickness : 0.015 to 0.020 mm (0.0006 to 0.0008 in).

REPAIRELBOW ASSY (18-110/190)2. Weld Filling Cracks

---

PARTS REQUIRED FOR REPAIR

---

---

Weld filler wire (P3009) (Z 10 CNT 18)

---

## A. Weld filling cracks

- (1) Argon arc weld fill cracks as instructed in chapter 70-35-10 "FUSION WELDING".

- Weld filler wire P3009
- Weld class B2

## B. Checking welds

- (1) Perform a class B2 weld inspection as instructed in chapter 70-35-10 "WELD INSPECTION", and covering :

- Water washable fluorescent penetrant test by method M 502 B, chapter 70-20-10 "DYE PENETRANT INSPECTION"
- X-ray examination as per chapter 70-20-10 "RADIOGRAPHIC INSPECTION".

- (2) Perform a pressure test at 0,334 hbar (relative pressure).

ELBOW ASSY (18-110/190)

3. Replacement of the Spherical Bearing with or without the Sleeve.

---

PARTS REQUIRED FOR REPAIR

---

Spherical Bearing	BAS 7641-04 (649-801-007-0)
Flanged Bushing	302-007-500-0

---

A. Introduction.

This repair give two spherical bearing replacement solutions.

- (1) For a first replacement of the spherical bearing in the elbow assy, apply solution B.
- (2) For a new replacement of a spherical bearing previously replaced by solution B; apply solution C.

B. Replacement of the Spherical Bearing.

- (1) Remove the 6 bearing outer race crimping points by drilling per figure 401.
- (2) Remove the spherical bearing from the flanged bushing.
- (3) Install a new spherical bearing in the flanged bushing.
- (4) Crimp the spherical bearing in the flanged bushing using a punch per figure 402.
- (5) Check that there is no axial play of the bearing outer race in the flanged bushing.
- (6) Check that the spherical bearing move freely by hand in the outer race.

C. Replacement of the Spherical Bearing and the Flanged Bushing.

- (1) Remove the 6 bushing crimping points by drilling per figure 401.
- (2) Remove the bushing and spherical bearing assembly.
- (3) Install a new flanged bushing in the bracket housing.
- (4) Crimp the flanged bushing in the bracket using a punch per figure 402.
- (5) Check that there is no axial play of the flanged bushing in the bracket.
- (6) Install a new spherical bearing in the flanged bushing.
- (7) Crimp the spherical bearing in the flanged bushing using a punch per figure 402.
- (8) Check that there is no axial play of the bearing outer race in the flanged bushing.
- (9) Check that the spherical bearing move freely by hand in the outer race.

1. Reconditioning the silverplating of the conical flange bores

PARTS REQUIRED FOR REPAIR

A. Recondition the conical bores of the flanges in accordance with the indications in figure 401, and the instructions on Method M 303 B a) in chapter 70-15-30 : "SURFACE TREATMENT METHODS", observing the following points :

- (1) Slacken off the flanges of the ball ends and hold them in position during operations.
- (2) The old silverplating is to be stripped off by Method M 109 A described in chapter 70-15-20 : "CLEANING METHODS".

NOTE : With the silverplating off, check that the parent metal is not marked by a dent perceptible by touch ; if it is, set the part aside pending adoption of an applicable repair scheme.

- (3) Check for cracks by the water-washable fluorescent penetrant process, using Method M 502 B described in chapter 70-20-10 : "PENETRANT INSPECTION".
- (4) Plating thickness 0.015 to 0.020 mm (0.0006 to 0.0008 in).
- (5) After plating, check that the ball ends come to bear fully on the conical flange bores.

REPAIR

BLANKING PART FOR ACTUATOR CAVITY (22-85/86/165/166/230/231/285/  
286/360/361/400/401/460/461/500/501)

1. Crack filler welding

---

PARTS REQUIRED FOR REPAIRS

---

Filler weld wire P 3028 (NCK 20 D)

---

A. Filler welding

(1) Argon arc-weld the cracks as per chapter 70-35-10.

(a) Filler weld wire : P 3028

(b) Class of weld : B2.

B. Inspection of weld

(1) Perform class B2 weld inspection as per chapter  
70-35-80.

(a) Perform local dye penetrant inspection using  
fluorescent water-washable product as per method  
M503B, in chapter 70-20-10.

(b) X-ray inspect as per chapter 70-20-30.

C. Heat treatment

(1) Perform annealing heat treatment on the blanking parts  
as per method M812, in chapter 70-45-10.

(2) Perform local dye penetrant inspection using fluo-  
rescent water-washable product as per method M503B in  
chapter 70-20-10.

REPAIR

ACTUATOR CAVITY BLANKING PART (22-85/86/165/166/230/231/285/286/  
360/361/400/401/460/461/500/501)

2. Repair of the attachment zone of the blanking part at the junction of the vertical panel of the actuator cavity and the rear frame fitting.

---

PARTS NECESSARY FOR THE REPAIR

---

Sheet metal P 3326. Thickness 0,9 mm	(0.035 in.)
Sheet metal P 3326. Thickness 1,2 mm	(0.047 in.)
Bar P 3620. $\varnothing$ 25 mm	(0.984 in. dia.)
Filler metal for welding	P 3028

---

A. Removal of damaged zones.

- (1) Eliminate damaged zones as shown in figure 401. Deburr.
- (2) If necessary, refill any cracks in weld beads as indicated in REP 22-85-1 of this chapter.

NOTE : Do not apply heat treatment after refilling.

B. Welding of the inserted plate.

At the point whose the blanking part is attached to the rear frame, install the plate as shown in figure 402 and as follows :

- (1) From sheet metal P 3326, thickness 0,9 mm (0.035 in.), cut out a plate dimensioned as necessary.
- (2) Form the plate and rework the edges to be welded to the cut away area. Deburr.

NOTE : Ensure continuity of shape of blanking part.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (3) Position and then weld the plate according to figure 402 and chapter 70-35-10.
  - (a) Argon arc welding. Class B 2.
  - (b) Filler metal : P 3028.
- (4) Check the class B 2 weld as indicated in chapter 70-35-80 and in the following conditions :
  - (a) Check for localised cracks using water washable fluorescent penetrant test according to method M 503 B of chapter 70-20-20.
  - (b) Radiographic, X-ray test according to chapter 70-20-30.
- (5) Smooth the weld bead in the flat zone to be situated beneath the reinforcing plate marked "3" (see figures 402 and 403).

#### C. Manufacturing of inserted parts.

- (1) From sheet metal P 3326, thickness 0,9 mm (0.035 in.), make the lugs marked "1" and "2" as shown in figure 404 sheet 1. Rework to fit cut out section.
- (2) From sheet metal P 3326, thickness 1,2 mm (0.047 in.), make the reinforcing plate marked "3" as shown in figure 404 sheet 2.
- (3) From bar P 3620, dia. 25 mm (0.984 in.), make shouldered washer marked "4" as shown in figure 404 sheet 3.

#### D. Welding of lugs and reinforcing plates.

- (1) Weld parts marked "1", "2" and "3" to the blanking part according to figure 403 and as follows :
  - (a) Position the parts and argon arc tack weld without filler metal.
  - (b) Weld the parts according to chapter 70-35-10 and following conditions :
    - 1 Argon arc welding.
    - 2 Class : B 2 weld.

OVERHAUL

3 Filler metal P 3028.

(c) Reforming of welded zone if necessary.

(2) Check class B 2 weld according to chapter 70-35-80.

(a) Localised check by means of water washable fluorescent penetrant according to method M 503 B of chapter 70-20-10.

(b) Radiographic X-ray check according to chapter 70-20-30.

#### E. Welding of shouldered washer.

(1) Trace out position of housing of the washer then drill as shown in figure 403 sheets 5 and 6 and chamfer.

(2) Weld shouldered washer according to figure 403 sheets 5 and 6 and chapter 70-35-10.

(a) Position the washer and argon arc tack weld without filler metal.

(b) Weld the washer according to chapter 70-35-10 and the following conditions :

1 Argon arc welding.

2 Weld, class : B 1.

3 Filler metal : P 3028.

(3) Check class B 1 weld according to chapter 70-35-80.

(a) Localised check by means of water washable fluorescent penetrant according to method M 503 B of chapter 70-20-10.

#### F. Drilling.

(1) Trace the position of attachment holes in the reinforcement marked "1" and "2" as shown in figure 403 sheets 3 and 4.

(2) Drill to dimensions indicated in figure 403.

(3) Deburr.

---

A. Removing the damaged nut

- (1) Remove the damaged nut by grinding out the heads of the fixing rivets.

B. Installing the new nut

- (1) Check the rivet holes as instructed in chapter 70-50-10 : "JOINTS MADE BY USE OF SOLID RIVETS".
- (2) Fit a new nut by riveting it as instructed in chapter 70-50-10 : "JOINTS MADE BY USE OF SOLID RIVETS", and as indicated in figure 401.
- (3) Check the riveting as instructed in chapter 70-50-81 : "INSPECTION OF SOLID RIVETS".

REPAIR

BALLSCREW GEAR BOX SUPPORT (25-10/90/170/250/330/390)

1. Renewing the ball joint

---

PARTS REQUIRED FOR REPAIR

---

Ball joint No. 301-125-200-0

---

A. Removing the damaged ball joint

- (1) Remove the damaged ball joint by machining the crimped ring and extracting the joint with a screw press.

B. Installing the new ball joint

- (1) Press-fit the new ball joint by means of a screw press and position it as indicated in figure 401.
- (2) Crimp ball joint on both its faces (see figure 401) using a punch mounted onto a screw press (see Principle in fig. 402).

C. Checking

- (1) Make sure that the crimped ring shows no end play.
- (2) Check that the inner ring can be freely moved by hand.

---

**A. Replacing Nuts on Throat Section**

- (1) Remove damaged nut by grinding out the retaining-rivet heads.
- (2) Fit a new nut and secure it by riveting as directed in chapter "RIVETING", section 70-50-50, in figure 401, and in the following instructions :
  - (a) Select nut suited to thickness "E" of unit fully assembled.

NOTE : - Figure 401 shows the Part No. of the nut for a theoretical thickness "E".

- (b) Mounting instructions for Nuts A 11471.

Ascertain before riveting the nut that the out-of-flush level difference of the bush lies within the tolerance limits laid down in figure 401. If it does, the free sliding of the bush in its cage is ensured after assembly of the convergent panel.

- (3) Check the riveting as instructed in chapter "RIVETING" section 70-50-85.

**B. Replacing Nuts on Angle**

- (1) Remove damaged nut by grinding out the retaining-rivet heads.

In this type of repair, there are 3 possible forms of assembly, viz:

**78-13-01**

REP 29-190-2

Page 401

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

Form 1 : Assemblies with nut attachment items readily accessible.

Form 2 : Assemblies with nut attachment items inaccessible.  
Here the support plates must accordingly be removed  
before the damaged nut can be renewed.

Form 3 : Assemblies whose attachment items are fully-assembled  
hollow bolts. Renew the thread inserts or, where neces-  
sary, the whole attachment item assy.

A. Renewing the floating nuts in the rear frame.  
Assembly type 1

- (1) Remove the damaged nuts by grinding out the fixing ri-  
vet heads as directed in Chapter "RIVETING", sections  
70-50-10 : Standard Assembly and 70-50-50 : Assembly  
with CHERRY LOK Blind Rivets, and in figure 401.
- (2) Fit in a new nut and secure it with rivets as instruc-  
ted in Chapter "RIVETING", sections 70-50-10 : Standard  
Assembly and 70-50-50 : Assembly with CHERRY LOK Blind  
Rivets, as well as in figure 401.
- (3) Check riveting of attachment items as directed in Chap-  
ter "RIVETING", sections 70-50-81 : Standard Riveting  
and 70-50-85 : Assembly with CHERRY LOK Blind Rivets.

Assembly type 2

- (1) Take down support plates and remove attachment items as  
directed in Chapter "RIVETING", sections 70-50-10 :  
Standard Assembly and 70-50-40 : Assembly by H1 LOK  
Attachments, as well as in figure 401.
- (2) Renew damaged nuts as indicated under Assembly type 1  
(1), (2) and (3), and in figure 401.
  - (a) Riveting in accord with 70-50-10 : Standard Assem-  
bly.
  - (b) Checking in accord with 70-50-81 : Standard Assem-  
bly.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) Remount plate assy and secure it with rivets as directed in Chapter "RIVETING", sections 70-50-10 : Standard Assembly and 70-50-40 : Assembly by H1 LOK Attachments, as well as in figure 401.
- (4) Check attachment items of support plates as instructed in Chapter "RIVETING", sections 70-50-81 : Standard Assembly and 70-50-84 : Assembly by H1 LOK Attachments.

#### Assembly type 3

NOTE : To renew thread inserts, the hollow bolt assemblies are to be removed and the hex. nuts discarded.

- (1) Remove damaged thread with Manufacturer's extractor tool.
- (2) Check that the locating tapping of the Heli-coil thread is clean.  
If burry, rectify the tapping with the Manufacturer's "finishing" taps (Heli-coil 14-28 thread, Class 3B).
- (3) Fit a new Heli-coil thread with a Manufacturer's threaded mandrel as indicated in figure 401, Sheet 9.  
Break off the tang with a breaking tool.
- (4) Make sure that the thread insert is properly fitted on as shown in figure 401, Sheet 9.
- (5) Fit back the hollow bolt assemblies as indicated in figure 401, Sheet 13.

#### B. Replacing floating nuts at throat section.

- (1) Discard damaged floating nuts by grinding out the heads of their retaining rivets, as instructed in Chapter "RIVETING", section 70-50-50 : Assembly by CHERRY LOK Blind Rivets.
- (2) Fit a new floating nut and secure it with rivets as directed in Chapter "RIVETING", section 70-50-50 : Assembly with CHERRY LOK Blind Rivets, in figures 402 and 403, and in the following instructions for floating nuts of the type A11471.

OVERHAUL

- (a) Choose a floating nut suited to the theoretical thickness "E" of the unit fully assembled (see table in fig. 401-402).
- (b) Ascertain before riveting the nut type All471 that the out-of-flush level difference of the bush lies within the tolerance limits laid down in figures 402 and 403. If it does, the free sliding of the nut in its cage is ensured after assembly of the divergent panels.
- (3) Check the riveting as directed in Chapter "RIVETING", section 70-50-85 : Assembly with CHERRY LOK Blind Rivets.
